>
>I'd like to get some input on this subject..
>
>Thanks

I just had my first experience at trading here. I offered a ham radio for sale in the rec.radio.amateur.swap newsgroup. After 7 exchanges with a ham in Georgia, discussing all details such as the price was "firm" and "not negotiable", and all the accessories I had, he made an offer equal to my exact asking price. He added one more question: "what is the condition of the radio?" I answered it was, "As new, in the box, and I would ship immediately upon his final confirmation."

His reply, "Oh, I made a typo error, I meant to offer ..... (less than he had offered previously.)

So my first contact on Usenet put me in contact with a ham that tries to take advantage of another ham in the 11th hour, 59th minute of the purchase.

I sent him private EMAIL asking if he did not understand the words "firm" or "price not negotiable" but he will not respond.

His name is Howard Ginsberg and his amateur radio callsign is NW1N just in case you end up in negotiations with him.

2. Telefunken Tubes For Sale

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: tatkins@unix1.sncc.lsu.edu
Message-ID: <3t2rt8$3cbl@unix1.sncc.lsu.edu>
Source record: 253183
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc

I have the following original Telefunken Tubes (Made in Germany) for sale:

ECC 81 (B5215024) x 2
ECC 82 (B2015126) x 2
ECC 82 (B6005926) x 1
ECC 83 (B5215001) x 2
ECC 83 (B3105701) x 1
ECC 83 (B81056??) x 1
EAM 86 (B3105800Sa) x 2

E-mail me and make a reasonable offer.

tatkins@unix1.sncc.lsu.edu

3. Pager message protocols

I am trying to find any and all information I can that is in any way related to the protocols used for radio paging. These include POCSAG, SUPER POCSAG, GOLAY and possibly others too.

Please would anyone who has any info on these Email it to me at tim@pixie.co.za.

Thanx.

5. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: bill@thd.tv.tek.com
Message-ID: <3t2rqi$8a5@news.tv.tek.com>
Source record: 253186
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 02-May-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the Frequency Set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately every six months (last update was Dec 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts

available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

6. BC 100xlt

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: mike.mollet@compudata.com
Message-ID: <8AC63C3.02F50056E6.uuout@compudata.com>
Source record: 253187

I have a Uniden BC 100xlt scanner and was wondering if there were any modifications that could be done to it to make it continous recieve from 30 - 512 megs, or speed up scanning rate, or something like that.. I would greatly appreciate it...
I will pass a usefull tip on to you now.. If you are ever stopped by a police officer, and you think he might check to see if the scanner has the police freqs in it, then shut it off, hold on the manual, 2 and 9 buttons, and turn on the radio with the 3 buttons depressed.. Instant memory erase... pretty nifty huh??

7. Monitoring 800 Mhz Police/Fire MDT transmissions

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: cadsuper <cadsuper@icon.net>
Message-ID: <3t312o$7se@news.icon.net>
Source record: 253188

I have heard several people talk about knowing HOW to monitor the MDT transmissions to and from police, fire, and EMS personell out in the field, but they have never elaborated on exactly how it's done. Was wondering if anyone out there knew specifically how it's done. The MDT's in my area run at 4800 baud, and I can get the frequency, it's just a matter of what can be used to decode it. I have heard that it's possible using packet TNC's that are commonly used with ham radio, but dont know the specifics on what options to set on it to recieve it and/or what model or brand is best to use with it? Any E-Mail on this would be appreciated.

8. Help with PRO-2004 CPU

>

Not exactly sure if the GRE microprocessors are Hitachi, NEC ect... but
they are certainly resemble a Japanese derivative. The "GRE-0327" marking
is a house number..you will not find it in a databook. If you were to study
and compare the pinouts, you might come up with a generic Japanese
processor.
To use the PRO-2006 -0918 micro in the 2004 would require some work
since the 2004 uses a 64 pin DIP IC and the 2006 uses a 72 pin PLCC surface
mount chip. I *may* be able to be retrofitted but would require some
time and patience to rig up a 72 oin break-out board that you could
solder the micro to then wire it up to the 2004 board.

9. Re: Coaxial cable help

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: saylboat@aol.com
Message-ID: <3t3169$ae7@newsbf02.news.aol.com>
Source record: 253190

Attenuation in cable is easy to compute since the cable manufacturers will provide the level of loss in DB at various frequencies. Remember that the higher the frequency the higher the loss. As a general comparison every 3 db of loss or gain reduces your signal strength relatively by half. Inversely when transmitting you can distort the raditaion pattern to cause electrical gain and each +3db gives you a logrithmic gain in signal strength. In other words my ERP (Effective Radiated Power) can be made to look like it is higher than it is by directing the signal where I want it (compared to a no gain /1/2 wave dipole/ omnidirectional antenna). So I can take a 10 watt transmitter and put it on a 3db gain antenna and have 20 watts of ERP. With 6 db this becomes 40 watts of ERP and with 9 db this becomes 80 watts of ERP. You must also take into consideration the loss in the connectors (1/2 db rule of thumb). I am sure I will hear a dissertation from the RF engineers here but I am only passing on some ways to rate antenna systems.

Investing in good co-ax means less loss. 1315 is an option, 1/2" Heliax and there are some new cables out by Times Microwave which are also very flexible and exhibit the same loss as 1/2" Heliax. If I were selling a system to transmit I would not be using RG6 or RG8 for anything over 50 feet. I will bring a attenuation worksheet in next week and post the information.

Everybody says this. Where can I find documentation on this?
There must be a place where the reasons were defined.

> CW> Many will tell you that it is to avoid FM capture if two stations talk
> CW> at once. I don't believe that is a primary concern today. Under
> Sure it is. Basic RF electronics. Still has not changed.

Well yes, electrons still go from negative to positive. So the basics
have not changed. But the FM technology we use today has changed.
Taking up less bandwidth is the main improvement - and more of that
will be coming. I still do not believe that we have to worry about
capture problems.

But you're right. With the value of spectrum, if we were setting up
the aviation service TODAY from scratch, we would probably use AM -
but not A3E! We would probably have half the spectrum and would be
using something like ACSSB just for efficiency (SSB is AM).
We'd likely have our coms on 220 or something.

Curtis

> >from 124.0000 to bay departure which is 121.3000. Then the guy from bay
> >departure says "Bay Departure, Radar contact." Can someone please tell
> >me what "radar contact" means???

"Radar Contact" simply means that the controller has positively identified you on radar and knows where you are. This way the pilot knows the controller can "see" him. The radar controller cannot control traffic he can't see. We you drop off a controller's screen due to terrain, etc., the controller will use the term "radar contact lost." This does not mean the plane is crashing - just that it left the "view" of the radar antenna.

Sometimes you will hear "radar service terminated". This means that the controller is no longer providing traffic advisory or separation service for the aircraft. This could be because the controller is too busy to handle some types of traffic, was unable to "hand off" the traffic to another controller, or has instructed the pilot to contact a facility that does not have radar (most towers do not have radar). You will not normally hear "radar service terminated" with airline traffic on IFR flight plans. It is common with VFR flights that are using "flight following" services.

>Everybody says this. Where can I find documentation on this?
>There must be a place where the reasons were defined.

I doubt it. Just go to a busy small airport on a Saturday and listen to the tower frequency. There will be several cases of stuck microphones, tower talking over a rambling pilot, etc. and you can usually make out all of the conversations. If it were being established today, it would likely be digital, spread spectrum, with certain codes reserved for ATC to override, and the tail number coded into the radio.

>but not A3E! We would probably have half the spectrum and would be
>using something like ACSSB just for efficiency (SSB is AM).

Remember the gestation period for an electronics systems change like that is on the order of 20 years. Do you think analog comms will be usual in 20 years?

-> Au contraire. More and more agancies are realizing the benifits of md
-> and are switching. What is not usually done via the mdt's is the
-> dispatching of calls; info re records, histories, et.c is the norm on
-> mdt's. One possible reason is the officer doesn't have to take his e
-> off the road to acknowledge a call., but once there he can investiga
-> people without tying up the dispatcher.

-> From: Daniel.Martin@odxabbs.tor250.org (Daniel Martin)

Well, for the most part this is true. However, many agencies dispatch
calls to non-priority details only over the MDT's. Only high
priority calls are distached over the air (along with MDT's), or to
officers who have logged themselves out of their vehicles on portable
radios. It varies from agency to agency.

Some Dept's I know of, rarely dispatch any traffic on the air at all
anymore.

Consider visiting your coax supplier and getting the spec sheets on the cable you plan to use. The sheets will show the loss in db per 100 feet at 100 MHz, 400 MHz, 800 Mhz, etc. You'll easily be able to determine what's best for your specific application. No guessing required.

Best regards,

Bill Fischer

That's even worse cause it transmits everything not just phone calls.

I have the AT&T version and bought it for that very reason. Do you
get random noise in your ever. It seems to be on my end only. The
person I'm talking to can't here it. Also, I find that many times
when I pick it up, the intercom light is lit and it won't pick up. I
must hang it up and wait for the charging light to flash, then it
works fine. I assume it's reprogramming the security code, which must
have become corrupted.

>me what "radar contact" means???

Hello Tom! I work for the FAA as a Radar Tech amongst a lot more
equipment that we are responsible for maintaining. I'm not familiar
with San Joses Freqs nor do I have them handy, but I can tell ya
basically how Air Traffic is controlled. Thus this will give ya some
insight on what happens at your local tower.
First off, all Air Traffic Control Towers (ATC) are responsible for
for Air Traffic within 55NM (Nautical Miles) of their respective
towers. Lets start with a plane taking off.
The Pilot requests permission after fileing a Flight Plan to Taxi to
the runway that Air Traffic is currently using. Ground Control in the
Top of theTower directs and Controlls the Ground Traffic, which
includes ALL vehicles and planes on the ground. Most of the time
depending on the Tower location, they have a clear view of the Ground
Traffic. The Controller then when conditions allow, directs Aircraft
to proceed via the Taxi Ways to the runway in preperation for take
off. The Controllers in The Tower Cab are resposible for that plane
for 10NM after which he Hands Off this aircraft to the Controller that
is located at most facilities in the Base of the Tower. That
Controller now has the responsibility from 10NM to 55NM, after which
he Hands off the aircraft to another Tower along that Pilots Flight
Plan. There's a LOT more that goes on than this but Basically that is
what happens at your Local airport. The opposite is true when the
Aircraft enter a Local Towers Air Space afterwhich the reverse of what
I said above occurs.
Keep in mind that we have other Facilities along the way that pilots
tune into which help them Navigate along Safely according to their
Flight plan. This includes VORS, Comm Equip, etc... A lot of times
these Facilities are located in very remote areas. In fact I use to be
stationed in such an area in Nevada. I use to maintain all equipment
within a 200 mile radius. Now I'm stationed at the Local Airport and
maintain All the Equipment in the Tower and at the Radar/Beacon sight.
Yes, it keeps me very busy! --)) Lot's of responsibility here.
I could go on and on but I'll stop here. If ya have any questions
feel free to post here or via Email!
Hope this gives ya a better understanding of what takes place and why
all the differant Frequecys are used and what for.

Sincerely
Brian

> continuous?

>>>>
Although I don't think anyone has discovered how to do it yet, a mod like the one discovered for the 220XLT would probably be possible on the 9000 as well. It involves installing a switch to power up the 800MHz RF section while the radio is not tuned to 800 MHz.
This causes the cellular frequencies to show up in some other (yet unknown) range.

Don't ask me for details. This is just theory. I'd like to hear if anyone figures it out though!

While I can't (officially) help you out on the Police side, I will be
happy to provide you with complete communications info for the Fire side.

If you have WWW access, you can obtain a complete list of all
LOS ANGELES CITY FIRE DEPARTMENT voice radio frequencies on-line.

Our URL is:

http://www.ci.la.ca.us/department/LAFD/index.html

I hope this helps. If you do not have WWW access, please E- Mail me or
write to my attention at the below address and I will be happy to provide
you with any LAFD info you need.

Happy Monitoring!

Mr.News (markj@sensemedia.net) wrote:
: money was recovered from a dumpster. Well I put 2+2 together and learned
: that there was a "RATPAK" transmitter in the money bag. Well I thought
: this was a great angle to a rather "routine" story,but the Managing
: Editor said we could not report that because a "deal" had been made with
: the FBI not to report the use of the transmitters.The reason she gave was
: that Las Vegas used to have the highest bank robbery rate in the nation.
: Well I think* that policy is B***S**T,but I can argue that on
: alt.journalism.

That's REALLY VERY FUNNY!!! Have you ever seen the movie "Ocean's 11"?
It's Frank, Dean, Sammy, Joey, Pete et al ("the Ratpack" as they were
known) who were all in the same unit in WWII (82nd Airborne, I think)
and decide to use thier military training to pull a heist in Vegas.
They got the money and drove it out of town in a garbage truck,
letting it cool down at the city trash dump. Great movie...and I'm
sure there's been alot of copycats from it, so it's very suitable that
they named the device "the RATPAK".

: Does anyone in Las Vegas know the EXACT FREQUENCY for the "RATPAK"s?
: I know that L.V.M.P.D. units have an array of three antennas in addition
: to the voice and mdt antennas on the roof. I can "read"antennas quite
: well,but these baffle me. I dont think these antennas are used for
: "lowjack" transmitters since these antennas were in place long before the
: "Lowjack" system was placed in use. I could be wrong,maybe they share
: frequencys.

It's LOJACK, actually. If I'm not mistaken, the freq is standard
nationwide at 173.075MHz. But as for the freq for a RATPAK, I'd assume
it would be very similar in freq allocation to LOJACK, that's just a guess
though.

Dave

: Please don't post where to "search" since I'm only in Las Vegas a few
: times a year now,
: and with the low power these things emit the chances of me being near
: one or near the next Las Vegas bank robbery,are pretty nil.

: If anyone is wondering just why I want this info...It's because I want
: to give up my current TV job and home on the beaches of the Monterey bay
: and robb all the banks in Las Vegas...and not get caught. 8-#

: Thanks
: Mark(Mr.News)Jeannette

: P.S. Las Vegas TV stations also WON'T report that Neveda Highway Patrol
: officers carry "SPIKE STRIPS" to blow out evading cars in high speed
: pursuits. Here in California,the cops fight over the chance to show TV
: cameras how effective the "SPIKE STRIPS" are.(go figure)

37. Alt methods to see video w/ R7000

Newsgroup: rec.radio.scanner
Date: 1995-07-01 00:00:00 UTC
From: gziolkowsk@aol.com
Message-ID: <3t51uh$ms8@newsbf02.news.aol.com>
Source record: 253218

I'm looking for an alternate method to demodulate video signals with my ICOM R7000. The TV-R7000 is too expen$ive new, and rare on the used market. My ideas were:

1.) Build a mixer to convert the 10.7 MHz IF output to TV CH2 (or 3). Then connect to standard TV. I could also mix to the usual TV IF of 45 MHz, and tap in there. (I just happen to have 34.300 MHz crystals in the junkbox.)

2.) Find a Hamfest VCR (cheap) that has a 10.7 MHz IF (Do they exist?). Inject the '7000's IF output and I've got video.

Anybody try something like this, or have a better idea? Or do I open the wallet and $pend buck$ on the TV-R7000?

Thanks
GZ

Frequencies stored in bank 1 have direct access. You press SCAN, HOLD,
then press DC/BNK so that DIRECT appears in the display. You can now
press 1 thru 0 to get to the first 10 channels.

To enter a freq, do SCAN, HOLD, and DC/BNK to read BANK, use up/down
to find an empty slot and enter the freq.

Does anyone know what frequencies are in use by the US Secret Service? I happen to work in a building that is frequented by an ex-president and I would love to hear what those guys are saying.

Thanks

I am going to Smokey Mountain National Park in a few weeks
and would like to know if anyone has any of the frequencies
for the Park Rangers, etc. Additionally, I will most likey be
traveling down from Shenandoah National Park in Virginia
through the Blue Ridge Parkway. If anyone has the frequencies
for those areas as well it would be appreciated. Thanks in advance.

MIR's Amateur radio downlink (as well as uplink) is 145.55MHz.
This is also the usual Ham Downlink for the shuttle's SAREX
missions. For this mission, the STS-71 will downlink on 145.84MHz,
and will listen on either 144.45 or 144.47MHz for voice uplink.

Hello Alan?

I think I answered the wrong poster here on this thing. I
answered the smart ass that gave you a hard time. I meant to
send it to you.

It was about 2-3 paragaraphs, so I will touch on the
highlights.

What I basically said was, that the higher the frequency goes,
the further away from the center of the tramsmit wire the
signal travels. That is called "Skin Effect." That frequency
has the tendancy to travel along the surface of things under
certain natural conditions..(Mother Nature)..Although the
signal was weak, it traversed along the neighbors clothes
lines, the power company lines the telephond lines, wet trees,
and bounced off the Ionosphere, which was probably fully
charged at that time of day. You can't fight Mother Nature.

I talked on my ham radion to California on 15 Watts at 28-Mhz.
for about 15-Minutes, until the conditions changed and I could
hardly get across the street, much less across the country.

So you may not have that happen to you everyday. But it does
happen. The portable phone frequency which that was, is not
authorized to use much power in the first place. It is usually
under a Watt....You must have a hot receiver in that scanner.
If you want further information on propergation of radio waves
etc, let me know..I will try and get you an answer. Take care

Warren. KB4STL...Richmond, Va.

Don't pay any attention to those folks that give you a hard
time about your legitemate questions. Take care.

53. PRO-2004 Problems

Newsgroup: rec.radio.scanner
Date: 1995-07-02 00:00:00 UTC
From: jsgill@axess.com
Message-ID: <3t63cb$tun@news.axess.com>
Source record: 253234

I have owned my PRO-2004 since 1989. In the past couple of years,
2 problems seem to have arisen.

First it does not seem to like summer weather. The rig, when switched on
comes up with a blank display and none of the function buttons beep when
pressed. After a period of time the rig recovers and starts to scan as
ordered. No memory information is lost.

The second is that the audio output seems to be much lower that it used to be.
I have to wind up the volume to get an acceptable volume level even with local
broadcast FM stations.

If anyone here has any bright ideas on what is wrong I would appreciate the
feedback, by either E-mail, or posting to the group. Thank you for the time.

Sorry I don't have the codes, have never needed them in fact, it's usually
pretty straight forward info with no special codes.

However I would like to get the new frequencies for the UCB Police since
they changed about a year ago.

Replace capacitor C213, a 100 uF 16V electrolytic. It connects
to pin 1 of the audio amplifier chip, IC7. Both parts are located
near the edge of the Linear printed circuit board.

Try 143.625 mHz (FM). This downlink is for Mir only to Russian ground
stations. Therefore, coms are in Russian only.

Enjoy,
Dave Hines - N2LAK

OK, first, UC-Berkeley just changed to a campus-wide 800 MHz trunked system. They gave up their 155.445 MHz main channel. Now UCB, Oakland (Piedmont & Emeryville piggy-back) and Alameda County have 800 MHz trunked systems.

As for Berkeley, there are very few 10-codes used. Most are penal code or other law sections. But here goes the main ones:

10-4 you know
10-7 out of service
10-8 in service
10-9 repeat
10-10 off-duty
10-15 enroute to jail w/prisoner
10-17 fueling
10-18 exchanging equipment
10-19 at/enroute to the station
10-20 what's your location
10-21 telephone....(us, someone, etc.)
10-22 cancel
10-23 stand-by
10-26 no warrants/wants
10-33 alarm
10-35 what time is it?
10-36 are you clear to copy confidential info?
11-94 pedestrian stop
11-95 vehicle stop
11-96 suspicious vehicle stop
11-97 officer welfare check (answer by "ring")
11-98 meet me <or> need cover
11-99 officer needs help
Code 1 at your convience
Code 2 immediately
Code 3 red lights and siren
Code 4 no further assistance needed
Code 5 watching, surveilling, etc.
Code 7 meal break

A few others pop up now and then--like 10-13 (what's the weather), but most everything else is plain English.

Interestingly, the response "ring" relates to a <very> early system pioneered by Berkeley for dispatching incidents. There were red lights hung in the middle of major intersections. When an incident was received

by telephone, the dispatcher would turn on the light in the area where the incident occurred. The officer would then "ring" in from the nearest call box. Hence the tradition-based response by officers on car stops, etc.

Hope this helps.
Gary Allen

The PRO-43 does not produce conventional images. If it did, the image would be approximately 1220 MHz above the displayed frequency, i.e. if you tuned to 900 MHz, the image freq. would be 2120.8 MHz.
If you want to receive images of the cellular band, you need a cheaper receiver <g>.

78. Re: Legal to monitor cell phones in Canada?

Newsgroup: rec.radio.scanner
Date: 1995-07-02 00:00:00 UTC
From: Greg Franklin <gfrankli@sfu.ca>
Message-ID: <Pine.SGI.3.91.950702224230.3513C-100000@fraser.sfu.ca>
Source record: 253259

Don't know the exact law but can confirm that no big deal about
monitoring cell or other phones up here. A few years ago there was a
big scandal with a politician who did some dirty tricks using a cell
phone and some scanner enthusiast taped him and released the tape to
the media....I think it taught Canadians that hard wire is more secure
than radio....legalites did not seem to enter into the discussion.
Scanners are sold here generally without mentioning whether or not cell
blocked or not except by the American chains up here who still advertise
that feature. My Icom R7000 is certainly not blocked.

>anyone hv frequencies for police in montreal?

Here's what I have:

Montreal PD 410.1125 Region 10 "west"
Montreal PD 410.2625 Region 20 "south central"
Montreal PD 410.4875 Region 40 "north central"
Montreal PD 410.6125 Region 50 "east"
Montreal PD 410.7875 Region 30 "central"

There are also some tac and data frequencies. I'd sure appreciate an update on these. I also have a list of Montreal fire stations (http://comp.uark.edu/~plaws/scan/) that I *know* needs updating. Take a look and help me out!

DJ> to override, and the tail number coded into the radio.

I wonder...
If we were actually change the comm system used on commercial & private aircraft, wouldn't we go to somethong much better than is presently used? I mean, assuming we could actually change systems, forgetting monty considerations, wouldn't we ba able to go to something much better than we are presently using?
Imagine: a computer-controlled system, linked nation-wide, with computer-controlled receivers in the aircraft. It would be something like a trunked 800-system, only nationwide. No more multiple aircraft on the same frequency. No more mis-adjusted comm radios in the planes, no more relying on the cockpit crew to tune the radio, just reliable, secure comms. Power levels determined by computer to match the need. Target info automatically sent on request.
Nahhh... Never happen.

Unless you want to do this as an exercise (in which case, all rationality goes out the window ;-)), I'd recommend that you visit a pawn shop and buy a small, portable B&W TV, hook it up to your Scanner Antenna, and use that. it works well for me as a monitor to watch News while I'm scanning.
Like I said, tho, if you want to do the other, fire away, but I can't help there, I'm afraid.

N> WUD LIKE THE "IMAGE FREQS" FER THE PRO-43...HELP PLSE!!!!
N> p.s UNIT CODE HAS THE "A"- NOT MODIFYABLE!!! DAMM IT! :-(

The first IF on a PRO-43 is 608 MHz (it uses UP-conversion).
This means that the images will be (608 X 2 = 1216) MHz off the original frequency.
Since the entire frequency range of the PRO-43 is less than that (30 MHz to 1000 Mhz, with gaps), this means that there will be no chance of receiving any images off that IF, and that's the normal image-producing IF.
The second IF is 48.5 MHz, so any images off that (low probability of any) would be (48.5 X 2 = 97) MHz off the original frequency.
One of the advantages of triple conversion is a low chance of images, and UP-conversion virtually guarantees no images.
Intermod is a different thing, but triple conversion does help to reduse that, too.
Hope this helps.

I am looking for an additional (inexpensive) scanner and saw the BC350A on sale at "Scanner World" for less than $100. Does anyone know anything about its performance. I would mainly be using it for local police, ham radio and 30-50 Mhz scanning.

A dumb question:
When examining sensitivity which is "better" 0.5uV or 0.3uV?
The sensitivity rating also mentioned "12dB SINAD"

Thanks in advance,
David

87. Ridley Twp. 506.3125 Phila area

Source record: 253080

I have lived in the townswip for many years. I began scanning
some years back, and have noticed an interesting evolution involving this
channel.
When first started scanning the area the ridley twp police dept
sounded like any other. one year, a while back, the police dept came into
some funds. they apparently spent the $$ on updating their radio system.
for a few years the twp had a scramble system that involved the
dispatcher telling the officers to "switch up". A couple years ago, the
township progressed further and now almost NO transmitions can be heard.
As of now, only the dispatcher and the handheld units can be heard. Al
car radio's are on constant scramble.
here's my question: ????*****????
Does anyone know what type of encryption/scrambling is used?
Is it possible to decode?
Does the township still use their ch 3 at all (508.9625)
now that they have the all the time scramble?
Why didnt they bother to install the scrambling radios in the
cars of Eddystone borough (dispatched by the township)?

to anyone who has answers...thankyou...

ben

p.s.--> its a real shame when you can monitor the entire county (state
and local PD's) but can't tell why the cops are banging down the door up
the street.

I believe you can do that in scan mode by hitting "HOLD/GOTO" to stop
scanning, typing in the channel number that you want, and then hitting
"HOLD/GOTO" again.

>annunicators lite. My guess is this is a thermal problem but I find it hard
>to believe a CPU (a piece of silicon) should have thermal instabilities in
>20 minutes.
>

The scanner has never locked up. Here are the details:

The first sign I had was a silent scanner. When I checked, it was scanning all banks with 0.0000MHz. I figured the battery may have been low and a recent power outage cleared the memory. I replaced the battery and programmed a few frequencies. Turning the scanner off for a few hours and then back on revealed all the frequencies had been cleared again.

Looking at the flow chart in the service manual, the possibilities were a bad "cpu control, Q30, Q31, Q32, Q34, D49" or a bad RAM, IC504. I pulled the RAM and replaced it temporarily. No improvement. I don't know what the "cpu control" does other than pull "HOLD" whenever the +5v power is off. Since the manual does not have timing or voltage threshold information on this circuit, I just assume it is working correctly.

Other observations:

Putting the scanner in program mode and then entering, say, 44<enter> results in 76.0000MHz being displayed. Pressing <manual> (sometimes) changes the display to something like 43.9984MHz. Going to another channel and returning will yield either 44.0000MHz or 43.9984MHz. Other frequencies that change during entry shows that the lower nibble is fine, it is the upper nibble bits that are changing. (44d=$2C, 76d=$4C, 54d=$36, 86d=$56, etc)

With a scope observing the R/~W signal on the RAM, sometimes the "RESTART" button will generate a string of writes to the RAM (clearing all channels), sometimes not. The same thing happens when the power switch goes through an ON/OFF/ON cycle. Sometimes this clears the RAM, sometimes not. RAM tends to be cleared whenever the power if off for longer that a few minutes. The only signal the CPU should see is "HOLD". Of course no response will be returned from the display IC.

>
>If it turns out to be the CPU in my case, isn't this a surface mount device?

The CPU is a DIP, the RAM is SOIC surface mount.

>How does one go about changing it out?

Changing the DIP is no problem. The RAM I removed by carefully prying the chip and being quick with the soldering iron. I then cleaned up the pads with solder-wick. I am going to try to put the old RAM back on the board since I don't have a source for such a small (2Kbyte) RAM, other than Tandy parts. It helps to have a very good soldering iron.

NATURALLY! :)

Yes, this is entirely possible. At my old house I had a Grove Scantenna, feeding a Pro-2006, and could pick up cordless conversations from 1 mile away like they were in the same room. I confirmed the location of one contact because the person they were talking to was in a distant city, and she was kind enough to give directions to her house to the person she was talking to. I am sure that if I can pick up a contact with this much signal strength from a mile, a 2 mile contact is not impossible. On the other hand, one day I saw my across-the-street neighbor talking on her cordless as I was walking to the park with my handheld to monitor some races. I picked her up on the way over, and she was still on the phone on the way back. (Not much to see *or* hear at the races, so I wasn't there long.) So when I got inside I fired up my trusty 2006 to hear the end of the convo. I got little or nothing. I could tell there was a conversation going on, but could only make out about half the words. The moral of this story: radio waves are funny things, and don't always behave in expected ways.

The variables here include general propagation conditions, and most importantly, the strength/quality of the base unit. The location of the base is also important, relative to your location.

Also, several people mentioned tuning to the handset side of the conversation to see who you're listening to. This only works if you are in range of the handset, which, as I understand it is transmitting at about 1/10th the power of the base. Actually, if you tuned to the handset freq and *didn't* hear anything, it would seem to confirm that the contact is distant (say, more than 1/2 a mile?).

Finally, I fail to understand the amount of "heat" that this post has caused. Here is a confessed newbie asking an honest question about his experience. Why flame him? Especially since most of the people who flamed him WERE WRONG! I appreciated all the help I got when I was new to the hobby, and try to pass it on when and where I can. I hope this contributes some "light" to go with the heat....

Good for him. (The entrepreneurial spirit part). Although I don't
think I would pay that much money for the specified scanner,
someone else might be willing and happy to do just that.

Call me a cynic, but this is the SOS as before. Grove seems intent on
turning this forum into another marketing venue. It's not bad enough that
I got to sort through the marketing crap to find useful bits of
information in MT (those guys sell their editorial like it's no
tomorrow--take out an ad and they'll hype whatever it is that you've got
to sell).

In the Regency M100 or M400, replace the 100 uF 16V electrolytic
capacitor connected to pin 8 of audio amplifier IC102.

It is located on the main printed circuit board and may be
labeled C173.

>124.0000. When the airplanes take off, the tower tells them to switch
>from 124.0000 to bay departure which is 121.3000. Then the guy from bay
>departure says "Bay Departure, Radar contact." Can someone please tell
>me what "radar contact" means???

>Oh yeah, if anyone also has a frequency list for all the airports in
>the Bay area(San Jose, Oakland, Moffit, etc...) can you please send me
>it thanks....

While Brian gave a very conclusive explaination of take-off/landing procedures, I don't think he explained the term "radar contact", so I'll try.

The airport radar is a two part antenna system, the radar antenna and an interrogator. The radar tells the guy in the tower "there's a plane there", but it doesn't say which plane it is. The interrogator sends a signal, which the plane receives and responds to with an IFF (Identify Friend or Foe in the military, I forget the civilian name) code, which identifies the plane. This code is displayed next to the radar blip on the tower (or bay departure, or the regional center, or where ever) screen, and this is how the controllers know which plane is which.

So the controller sees a blip, a code next to it, and he tells the pilot "radar contact". It's just a fast way to say that he has the pilot's plane on the radar screen.

hope this helps

I have an old Police-radio scanner, called KRACO PRO 20 MARK II,
and I can't use it because I don't have any dokumentation how to
set the different frequencies on the scanned channels.
The frequency is set by setting 11 different switches in different
patterns.

I wonder if someone knows where to get this
information.

The company who imported this scanner has gone out of buissiness,
so I can't get the information there.

Any help appreciated. (By mail if possible)

>
>
Gary is correct. There are two versions of the 2026. The earlier
version says Patrolman on the face and has three leads molded into the
back of the set. The newer version says Radio Shack on the face and has
a two wire, detachable plug for the 12v supply. The newer version also
has a flip down leg and non-voliatile memory which rat shack claims will
maintain programming for at least 14 days with no power. I have both
versions of the rig. A friend recently lost all memory on the new
version. When we re-programmed the rig, he still did not recover use of
the air and wx scan buttons. We may try to reset the CPU (hold down the
2 and 9 keys while turning the scanner on) when we have the time to
reprogram 100 channels again. I also would like to find the cause of
this unexplained loss of memory.

>receiver <g>.
> /* barry /&

My "cheap" AR8000 picks up cell images just fine above 1.42 gig. It has nothing to do with cost, but whether the scanner can receive the image frequency. The image is produced in the PRO-43 as well, but the upper frequency limit being just short of 1 gig does not allow the image to be received.

Access 1.0????

Get a copy of Access 2.0 - it works!

I've extracted data using access, but the quickest method is to use the DOS program supplied with Spectrum. Have it create an extraction file (.dbf format) and then use Access to attach to it (or import it). You'll be working with a much smaller file and will have much quicker response.

ronr@hooked.net (Ron Rounds) writes:

>I'vehad my bc3000xlt for a few weeks now and it works great. I was
>wondering if anybody knew any modifications or tricks in operation for
>it. The manual is just barely enough to get started.
>Thanks, Ron

Here's part of what I posted to SCAN-L:

Anyway, the '3000 is great. I am having loads of fun listening to 800 MHz and I'm having loads of fun with the auto-store. The manual, however, is, umm, "lacking". There are a bunch of power-on toggles that are not mentioned (See list below) and a couple of features omitted.

I'd also be curious to hear how these tricks relate to the PRO-26 (allegedly the same innards) and the UBC3000XLT (the UK/Export version).

Cut'n'paste: There is a second way to cut'n'paste frequencies. Following the directions on page 13, #6B, you can paste a frquency from it's current memory into any other memory just like when searching. SND, SND, enter channel number, HLD, E.

P-ch-Lockout: Comes up when you try to engage Priority and all priority channels are locked out.

Search: the radio remembers what frequencies are locked out during searches even if you search another pair off limits and then come back.

How do the "Turbo" (above PRI) and B-SAVE (above DLY) functions operate?

Power-on toggles:

In a Usenet post to rec.radio.scanner from D. Michael Grogan <m_c_0007@frank.mtsu.edu> and in his April _MT_ article, Bob Parnass <parnass@ihlpf.att.com> the following power-on toggles are listed (note: this is their work, not mine):

(Note that the indicator element for the function being modified usually lights up along with the option)

Power on holding:

SCAN: toggles "scan direction"

o Does anyone know what this really does other than illuminating the up arrow during scanning? The two indications are "On dir" and "OFF dir".

MANUAL: skips the welcome message (only that time - not permanenetly)

DLY: toggles delay. "2 SEC" or "4 SEC"

LHT: toggles light mode
"On Light" - light stays on until LHT pressed again
"OFF Light" - light goes off after ~15 seconds

AUTO: toggles auto sorting during scan
o what scan speed penalty does one pay if one chosses not to sort?

E: disables keyboard beep (thank goodness!)

SFT & 1: "test-1"
SFT & 2: "test-2"
SFT & 3: "test-3"
SFT & 4: "test-4"
o cool, but what do they *do*?

SFT & 5: toggles battery save

SFT & 6: toggles user selection of mode (AM/NFM/WFM)

Power on, holding 2, 9, and:

SCAN: loads "test" frequencies into channels 1-14 and 21-30

MANUAL: resets scanner and clears all memories - USE WITH CATION!

L/O: tests all display segments

DLY: turns off delay on all channels

key lock: displays ROM revision?

o Bob reports his review unit displayed "EEECH" (hexadecimal) and then
"USA 0.09". Mine reports "74cdh" and "USA 0.20".

Hiya. Got the bug to shop for a handheld portable scanner. I saw a Bearcat SC150 at a local store for $200, but from what I read here I'm not too thrilled about some of its limitations.. notably the inability to select a scan freq not in bank 1 and limited setting for scannng freq ranges. What else is out there in that style that I could look at?

i have a little BC210XLT at home.. no 800 or real fancy stuff, but a nice little unit.. any mods i should know about?

> Thanks.....
>

No, that cannot be done. About the only way to receive 800 MHz on
this radio is to buy a converter that will convert the 800 MHz freqs
to 400 MHz range, which this scanner can receive.

130. Mods for Pro39?

Newsgroup: rec.radio.scanner
Date: 1995-07-03 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3t9hh9$1f9@usenet.INS.CWRU.Edu>
Source record: 253159

WHile looking around at the oakland server, I read that some of the radios have mods as simple as holding down certain keys, to say keep the light on , etc. Are there any of these types of mods for the Pro39? Perhaps even soemthing that is inthe manual? SInce I bought my scanner used, I did not get a manual.

Thanks for any tips.

Drew

Message-ID: <ljy4oma00YUyQNDINJ@andrew.cmu.edu>
Source record: 253161

I have a Bearcat 100XLT I no longer need, please make an offer on it if
you are interested. I have the manual, carrying case, and charger. 100
channels in 10 banks (can be modified to have 200 channels if you order
new memory chip and a few other parts). I really like the portability
and looks of this scanner.
Ryan

133. Pro39 quest. (another)...

Newsgroup: rec.radio.scanner
Date: 1995-07-03 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3t9k1l$587@usenet.INS.CWRU.Edu>
Source record: 253162

Sorry, but I forgot I had another...

Why can I not just enter a frequency in to the scanner to monitor briefly. What I can do is punch inthe frequency to program a channel, but I can't just punch it in to listen to it on manual. Is this normal? The scanner says direct entry on the front of it, but since I bought it used, I don't have a manual to reger to as I said in my other note. :)

Thanks for any ideas!!

Drew
loker@tenet.edu

134. Frequencies out of order??

Newsgroup: rec.radio.scanner
Date: 1995-07-03 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3t9k2a$58b@usenet.INS.CWRU.Edu>
Source record: 253163

As I have filled up the 200 channels on my Pro39, I have tried to keep them in order, but invariable, they have gotten really out of order with in any particular band, and between bands. Usually, between bands is not a problem except for the 800 mhz bands which I have dedicated 5 bands (100 channels) to. SOme are in order, but they jump around, for example:

889 to 893 to 879 to 872 to 860 to 859 to 860 to 920 to 863, 862, 851, 852, etc.

Does this affect perfromance? I have them in order on a spread sheet so it wouldn't be that hard to repgram it, just time consuming and tedious.

Thanks for any ideas!!
Drew

This question has been asked several times in the last few weeks and so
far no one has posted any freqs. Yes, we know they encrypt but so what?
If anyone out there has any real numbers, please share them. We don't
need people to tell us it's not worth our time to monitor.

Hi, well, ScanStar will save the bandplan in a file. If you have already done this, do you notice how the next time you fire up ScanStar and go to band plan modification, it says that there is already one saved, to use that or re-read from the scanner. Well, I need that file. I do not know the name of it, but I will find out.

>

>Is there a Canadian 800 number for Tandy National Parts?
>

If you look on the bottom of either the front page or back page of any
R/S flyer, you should find the Canadian 800 number in small print. Be
warned, though, they charge 5-15 times the US price (yes, even after
exchange) for some parts, and they have heavy shipping charges.

Regards

>Q#2 Big No No. Intercepting the transmission is a little grey.
>Reading confidential police records, Big No No...
>

actually.. I think there is no problem monitoring MDT's becouse it is
being brodcasted into open airwaves.. In some places the Fire, EHS,
Police,etc. Give the Media MDT receivers to look up on current events..
I could be rong but I read that somewhere......
My friend has a card for his computer that receives MDT hooks rite into
his scanner or whatever...

Uniden/Bearcat BC 200 XLT-Scanning Radio

$150 or best offer. I'll Pick up the Shipping Charges!!!

Features Included:

-- 200 Channels (10-20 channel Banks w/ 10 Priority Channels)
-- 12 Bands + Instant Weather Button:

10 Meter Ham: 29.00-29.70 MHz
VHF-Low: 29.70-50.00 MHz
6 Meter Ham: 50.00-54.00 MHz
Aircraft: 118.0-136.0 MHz
Military Land Mobile: 136.0-144.0 MHz
2 Meter Ham: 144.0-148.0 MHz
VHF-High: 148.0-174.0 MHz
Federal Gov't: 406.0-420.0 MHz
70cm Ham: 420.0-450.0 MHz
UHF: 450.0-470.0 MHz
UHF-T Band: 470.0-512.0 MHz
800 MHZ: 806.0000-823.9875 MHz/849.0125-868.9875 MHz/894.0125-956.0000 MHz

-- Scanner Speed: 15 channels/second
-- Search Speed: 25 Frequencies/second
-- Illuminated Green lighted LCD
-- 12 VDC Power (Rechargable NiCad Battery Pack & AC Adaptor Cord)
-- Flex Antenna w/ BNC Connector
-- Earphone & Shirt Clip Extension Speaker (Both w/MiniPlug Adaptors)
-- Leather Carry Case w/ Belt Loop
-- Operating Guide + Modification Instructions Included

Great for a first time buyer or for extra carring unit!!!
***Fully Further Modifiable

Serious offers only please contact Andy for further details...

X-News: vax rec.radio.amateur.antenna:10833
From: wa2ise@netcom.com (Robert Casey)
Subject:J Pole program for MSDOS computers
Date: Tue, 20 Jun 1995 04:19:12 GMT
Message-ID:

This program JPOLE.EXE calculates the lengths of the elements of a twinlead
Jpole antenna. Uses regular (not foam) TV 300 ohm twinlead, also be
sure to use a choke coil or ferrite bead on the coax at the feedpoint
(creates a 1:1 balun).

Program runs on MSDOS PC's.
========== NETRUN V2.3D DOS PROGRAM ==========

THE FOLLOWING text is an executable NETRUN program. It does NOT require
decoding. Please follow these simple steps:
Don't worry about that this posting having the MSB stripped off, the below
is designed to survive passing thru 7 bit systems (e-mail and netnews
strips off the MSB, thus they are 7 bit systems). So, I guess this
post is not a "binary". :-)

1 Use a DOS TEXT EDITOR to clip the line below and end of text
2 Save the clipped portion as JPOLE.EXE
3 The program will execute when you enter JPOLE
To extract the original program enter: JPOLE -DECODE

.... Remove this line and everything above it ....

Wrong newsgroup! I have redirected your request to the correct groups. Yes photojournalists will use scanners to find news stories but your request is better suited for one of the scanners newsgroups.

cheers

149. Re: Cordless from miles away?

Newsgroup: rec.radio.scanner
Date: 1995-07-03 00:00:00 UTC
From: dhubba@access2.digex.net
Message-ID: <3ta1gt$aep@access2.digex.net>
Source record: 253178

Receiving a cordless call from two miles away is not an everyday
experience but it is VERY possible. The following factors probably
contributed to the reception:

- the "target" probably used the cordless phone as the manufacturer
suggested to maximize its range (i.e. fully extend the whip on the
base, place the base on the top floor of the house).
- nearly every scanner has a superior receiver to the one in the cordless
handset (and the antenna on the cordless handset is
non-resonant at 49 Mhz).
- I'd also bet that the original poster used an external antenna on his
scanner (instead of the crummy built-in whip).
- Finally, a target whose height above average terrain was greater than
the scannist would also help.

What we're talking about here is a line-of-sight signal. Given a clear
shot (no buildings etc.) from the cordless base to the scanner and some
(if not all) of the above factors, this is very possible.

I believe that this is not a case of sky-wave propagation of a 49 Mhz wave.
First of all, two miles is within any skip zone (if this were an ionospheric
hop) and the we're pretty much at the bottom of the sunspot cycle anyway.
Other types of propagation are possible (e.g. sporadic E) but with the
power levels in question, the modulation and signal, and *only* two miles,
this sure sounds like line-of-sight and an ideal set-up.

David

In article <3t4otl$kmk@newsbf02.news.aol.com>, garya27446@aol.com says...
>
>Yea, we were wondering why you wanted to know this. But even your
>smart-aleck answer didn't quite answer it.
As much as I hate to respond to Lame Flames, just can"t resist!
>What's your point? There's a radio system, crooks get caught. What else
do
>you want to know? It's not like you going to hear Tony Bennette singing
on
>the Pronet channel, right?
>Gary Allen
Well Gary,..If you read the whole post you might be able to figure out
that I am a T.V.NEWS Videographer That gets PAID to get shots of
"crooks"getting arrested after they robb banks. I don't need their
permission to take their pictures and I don't need your permission to ask
for a frequency on USENET. Did this request annoy you. Thank God SOME
people on USENET don't mind helping out and adding to USENET. I would
hate to be the person who asks you for a cordless phone frequency.
No "point" was made or implied with my post. Just a little humor and
some observations from my former job in Las Vegas.
Next time take your flames to alt.aol-sucks.

Oh BTW I got the frequency and some great background info on the Protrack
system. When Protrack comes into use here in No.California I will be
ready....BetaCam and all!

Thanks to ALL who gave real replys.

Mark"Mr.News"Jeannette
The smart-alec that gets paid to listen to scanners!

Sorry to the rest of this group for the drivel.

>Try 143.625 mHz (FM). This downlink is for Mir only to Russian ground
>stations. Therefore, coms are in Russian only.

Since the Russians disbanded their ship-based space tracking network
they now use 143.625 only when the Mir is flying over Russia.

When they had a tracking ship south of Nova Scotia the entire
northestern US and eastern Canada could hear the cosmonauts check in
with the ship several times each day.

Russia also has a version of NASA's TDRS but it's not fully
operational.

on >him instead? I'm somewhat curious myself.

>Mark

It's only very easy if the handset is within about forty feet of your house.
I've only RARELY been able to catch the handset, even when the base is loud
and clear. If this was really a hit on someone with a .3 watt VHF transmitter
2 miles away, then I'd say the possibility of picking up the base AND the
handset is almost zero.

Also, I wasn't ragging on the guy. I've spent days trying to track down
cordless transmissions because people usually don't give their full name. It
usually takes quite a while to figure out which one is on the cordless. Many
times I've heard someone say "I'm outside doing this or that." and it turned
out they weren't the one I was scanning, and they were both using cordless
phones.

In the case of picking up someone miles away, this is the most likely scenerio.

>train that I could pick up when they're running by my area????
>
>Thanks, Jeff
>
>JDnFmtCA@ix.netcom.com

Try these frequencies:

161.265 -- [AAR channel 77] -- carmen
161.325 -- [AAR channel 81] -- MOW
160.305 -- [AAR channel 13] -- passenger services
160.800 -- [AAR channel 46] -- road (Northeast corridor)
161.280 -- [AAR channel 78] -- shop switcher
160.545 -- [AAR channel 29] -- special agents

Amtrak will also operate on the frequencies used by the railroad whose
track it is using, so you might want to browse through the North
American railroad frequencies page at
http://ux1.cso.uiuc.edu/~roma/rr-freqs.html#byroad.

Hope this helps.

-Gavin Essenberg

172. BC80XLT info wanted

Quoting jeremy7281 from a message in rec.radio.scanner
N A friend of mine just purchased a BC80XLT for $250. I (and he) really
N don't know anything about Bearcats and purchased this pretty
Nblindly(I'm still using my Pro-42). Is this a good unit? Was that a
Ngood price? Is there a mod. for it? Any other info worth noting?
N Would appreciate a reply here or e-mail. Thanks.
N -Jeremy
A couple of weeks ago I bought my BX80XLT from Wal-Mart for $149.95.
Sorry to say but someone made some good profit on that sale.
It is a good little hand-held scanner, the only real complaint that
I have about it is the volume level. In an environment that has
some background noise, and the scanner at full volume, you will
still have to listen close to hear what is going on.

I have just got an ICOM IC-R7100 and a CT-17 CI-V level converter. want to use the IC-7100 from remote from my comouter but ICOM don't supply software for their product ! I have called the U.S. 5 times with not one bit of luck. I have looked all over the net and all I found was a program written for the IC-7000, and this program didn't work !

Does anyone in the net world know of a program I can use with the CT-17 to access my IC-R7100 remotely ?

Why don't ICOM support their OWN product ?

Could it actually be "SOCAL"?

Socal is short for Southern California Tracon and is the result of the consolidation of the Burbank, Los Angeles, Coast, Ontario, and San Diego air traffic control facilities. Socal is located in a brand-new facility on the Miramar Naval Air Station in northern San Diego County.

>>side of town almost 2 miles away! How could this have been possible? Do
>>these frequencies skip around?

Yes, they do if conditions are right. I have a friend who has talked
all over the world on the 6 meter amateur band (50MHz) with less than
a watt of power. With nothing blocking the signal, a cordless phone
transmission can be picked for several miles. This is providing the
frequency is clear and you have a line of sight to the phone. It is
likely however that the other gentlemen was right and the person who
gave there location was on the other end of the conversation and not
the cordless.

Naturally, I discovered this freq. by
>>accident.

Naturally.

>mikef@anshar.shadow.net (Mike Fink) wrote:

>>I am currently using rg8x in a 100ft run,would I gain any advantage by
>>switching to RG6-U.

RG-6/U is 75 ohm cable. If you want a lower loss cable look at the
chart below. It give the losses for several cables at several
frequencies:

Loss per 100 FT. at Freq

Belden Cable Type 900 MHz 400 MHz 100 MHz

9913 (RG8 semi-solid) 4.2 dB 2.7 dB 1.3 dB
9914 (foam) 5.7 dB 3.5 dB 1.6 dB
9251 (RG8 non-contam) 7.6 dB 4.1 dB 1.9 dB
8267 (213 polyethy) 7.6 dB 4.1 dB 1.9 dB
8214 (RG8 foam) 6.7 dB 4.2 dB 1.8 dB
9258 (RG8X foam) 12.8 dB 8.0 dB 3.7 dB
8219 (RG58A foam) 13.8 dB 9.0 dB 4.5 dB
8240 (RG58) 16.0 dB 10.0 dB 4.5 dB
8259 (RG58A) 20.0 dB 11.5 dB 4.9 dB

As you can see, cable loss is greatly dependent on frequency. 9913
will give you the best performance of any flexible cable, but if you
generally monitor VHF, it's may not be worth it. If you monitor
800MHz a lot, it will make a noticable difference. One thing is worth
noting. 9913 is a semi-solid cabling. It uses air as a dielectric.
In other words, it's like a garden hose. What this means to you is
that you must seal the antenna end with silicon and weatherproof the
connector very carefully. If water gets in the cabling, it will
degrade the performance to worse than with RG-58/U and ruin the coax.

>> I plan on using one antenna for two scanners
>>and would like to keep the signal loss down to the minimum. I also plan
>>on adding a Grove's Pre-5 to my antenna.

That's probably Selcal, a contraction of the phrase "Selective
Call." Each receiving station has its own unique code and
decoding apparatus. The base can page an individual station by
transmitting its code.

One often hears ground stations transmitting "Selcal Checks" on
the ARINC shortwave frequencies used by overseas aero flights.

Does anyone have frequency suggestions for the Long Island Railroad? I have had very limited success with 160.455 MHz. I am not getting anywhere with 160.380, 161.445, 161.265. I'm located in North Central Nassau and usually boast excellent reception... I think I must be looking in the wrong places.

I'm also interested in obtain active AMTRAK and Metro North frequencies...any suggestions?

I have monitored two (2) freq's that are quite active with rail related police activities. I am pretty certain that these frequencies belong to MTA Police. I've heard Queens references and Bronx references...the freq's are: 160.500, and 160.965. Could anyone provide additional info about these numbers, AND I would appreciate more MTA frequencies.

Finally, are subway sub-surface transmissions relayed above ground? Where are they?
Thanks,
JeffCLI@AOL.com

180. Upper 400's(MHz) Mystery Stations

Newsgroup: rec.radio.scanner

From: jeffcli@aol.com
Message-ID: <3taf7l$1p3@newsbf02.news.aol.com>
Source record: 253047

I am located about 10 miles east of Queens on Long Island....
I have been hearing some active frequencies during scan searches. I haven't recorded the frequencies, but there are at least ten active hits from the mid to upper 400's that I can't figure out.
These frequencies are all Spanish Speaking Voice transmissions... I know some Spanish, but these guys are speaking extremely fast and with a strange dialect. All these stations are using high quality transmission equip. One station actually sounded like a "numbers" station so common on shortwave. There appears to be several different locations transmitting on each of these....they don't sound "official or commercial" they often sound like they are talking casually and I hear nothing like a id from each party.
These could be cab, couriers etc. companies deep in the heart of the Bronx or Queens....but there doesn't seem to be any unit id spoken. The other possibility is that they are part of a much older business that works tax free...
I would appreciate any insight... they can always be found.... I'll write the freq's down next time so others can confirm.

Generally speaking, since electrons move at the speed of light and there are no mechanical parts (to speak of) in most scanners, no, it does not make a difference if your frequencies are in any specific order. Best to organize them in banks that you can choose or lock out depending on what you want to hear. Your convenience is most often the only factor that matters in the organization of what space has what frequency.
"You can sit here in the waiting room or wait here in the sitting room."

The "civilian" term you are thinking of is Mode-C. Or more
generically called a transponder "squawk". At least that is
what is currently used. When secondary survailance radar interogates
an aircraft transponder, it replies or "squawks" with a 4 digit octal
code assigned to the aircraft for that flight (the pilot dials in
code given to him by the controller or before the flight when
receiving a clearance). Mode C replies also contain the plane's
pressure altitude from an on board altitude encoder.

ATC computers use the four digit code to determine and disply the
aircraft call sign and altitude (corrected for local altimeter
setting). The computers can also display the ground speed of the
aircraft by traking the target and doing the time and distance
calculations - the transponder does not send speed info to the
computer.

When you hear news stories about FAA ATC computers going down, it
usually means they can't use the transponder replies for information
and have to deal with raw radar, if they have it. An ATC specialist
could address that better - it's been a while since I have toured a
center and asked any questions.

I fly out of Livermore (where everyone with a plane seem to want to be
every weekend) You can tell when 2 or 3 key up - but usually don't
understand any of it - AM squeals like a pig when people double. The
tower can step on some people because they usually have more power.
But then your are talking about the same "practical" effect as FM
capture. As someone that uses FM quite a bit outside the cockpit, I
can tell you that nFM capture is not a problem - you can tell when two
users key up at once - like the AM squeal, FM has the growl of
hetrodyne. Sometimes it is just a faint buzz, but it's there.

> >but not A3E! We would probably have half the spectrum and would be
> >using something like ACSSB just for efficiency (SSB is AM).
>
> Remember the gestation period for an electronics systems change like that
> is on the order of 20 years. Do you think analog comms will be usual in
> 20 years?

The techonology used in avionics will not likely be on the cutting
edge. The industry and the users like stuff that is tried and true.
Take GPS for example: It is becoming pretty routine to see that stuff
but we will have ground based radio nav aids for aircraft into the
next decade at least - by the time the world of aviation fully
embraces global positioning and replaces VORs, you'll have a GPS
in your wrist watch - with the cellular (or PCS) telephone. And
the ones in airplanes will still cost 10 times as much as others.

A guy here at work just replaced all of the radios in his plane -
new solid state gear - he was able to get rid of 30 pounds of
tubes behind his baggage compartment. Tubes are still flying around.
Shows you how fast we move ahead.

But whatever - I give in. I hereby now declare that I agree with
everyone else - aircraft communications are AM because FM has
that awful capture effect that could get folks killed.

Take Care

After the plane has taken off and the tower controller has handed the plane off to the departure controller (the pilot is told to contact departure on a different frequency), usually the first thing the departure controller will say is "Radar contact." This just means that the controller sees the plane on his radar scope and knows which one it is, of the dozens of planes he sees.

Your library probably has some books that will walk you through the procedures.

And for folks looking for local aircraft frequencies, just go to some small airport in the area and at the FBO ("fixed base operator" -- - the airport manager) office buy a "sectional" chart --- an aviation map of the area that will have most of the frequencies.

Have fun!

From: Dean.Dalrymple@odxabbs.tor250.org
Message-ID: <80c_9507050550@tor250.org>
Source record: 253093

Hi,

Canadian Radio Shacks have the PRO-43's on sale so I went on a hunt for a pre-April '94 model. During the search a friend and I discovered that the A in front of the serial number is not an accurate indication of whether the scanner could be modded for cellular or not.

We came across a number of 10A4 (Oct. '94) and 12A4 (Dec. '94) units, which are obviously not modifiable, that did NOT have an A at the beginning of the serial number. Oh we did find a 5A4 (May '94) that did have the A.

BTW I did eventually find one that was modifiable, the store even had at least one more.

Dean :)

... DANGER! DANGER! Scanner store ahead -> Hide wallet.

> 1- Are they any good??

Yes.

> 2- How many hours do they last in use in a scanner??

About 1/3 more hours than nicads.
The actual number depends on the current consumption of **YOUR**
scanner.

> 3- How long to charge from a flat battery??

Depends on the charger.

> 4- Are they worth the money??

In my opinion, only if you have an external charger DESIGNED to
charge NiMH cells properly (the internal charge circuits of
scanners will not do so and they will work like nicads at best)
and you plan to use the scanner within
a few days of charging the cells - they self-discharge (i.e.
GO DEAD JUST SITTING THERE) at a rate 3-9% of capacity every
day.

> 5- Do you know where to bye them for less??

I assum you mean "buy". (You "bye" a cell by throwing it into
a proper recycling receptacle).

Very few companies sell or market NiMH penlite cells in the US.
$4.50 per cell is a decent price.

> 6- Or should I use NICAD AA 850mAh @ $1.50

Certainly a lot easier and more convenient approach.

Better yet:
Go to the same FBO (any place that gives flying lessons will do) and
ask for the "Aiport/Facilities Directory" for your region. It will
give much more information than the sectional charts and also cover
a much much larger geographic "listening" area. The publication
is updated every 90 days and floats around 350 pages at a giveaway
price!

Well Dave,
I'm trying to remember what was the deal to make the 30 knz step kick in.I
THINK it was press "reset"on the keypad after you put the limits in.Or maybe
before,it was a long time ago...
I do know it was really simple.

199. Ft. Bragg, NC frequencies?

Newsgroup: rec.radio.scanner
Date: 1995-07-04 00:00:00 UTC
From: bud@nando.net
Message-ID: <3tbfp9$nub@parsifal.nando.net>

Cross-posted to: rec.radio.scanner,alt.radio.scanner,triangle.general

Does anyone know any frequencies used at Ft. Bragg? I am going down there tonight for the Fireworks and figured I'd bring the scanner while the wife is out looking at the crafty stuff.

TIA

Does anyone have experience with the Grove Scanner Beam? Does it work better then the Radio Shack All-Band Roof Antenna? Does any manufacturer make a 46-49 MHz antenna besides CRB Research?

: > shows?
: > Don

: Some of the newer wireless mics are using the lower quarter of the 800Mhz
: range.

wireless microphones can turn up anywhere. There are some in the low band
(30-50mhz), some in the (162-174mhz), some in the TV area (174-225), They
can also turn up in the business band (457-467mhz) and may be also found
in the 800 or 900mhz band. the MONITOR AMERICA book has a listing of
several hundred wireless mic/fast food frequencies on about page 810

: Better yet:
: Go to the same FBO (any place that gives flying lessons will do) and
: ask for the "Aiport/Facilities Directory" for your region.

You can also get a SID/STAR procedures book from an FBO or pilot supply
store like Sportys. I have a terminal procedures book for the southwest
and for the west coast. Therterminal procedures help you identify when a
plane says its on the DRAKE departure... you have all the frequencies for
that routing as well as the routing info.
SID=Standard Instrument Departure STAR=Standard Terminal Arrival
hope this helps! Why not visit a local ATC or center facility too!!

>try.

Your right I didn't!--)) Was just trying to give a general description
of what takes place at the Local Tower.

>The airport radar is a two part antenna system, the radar antenna and an
>interrogator. The radar tells the guy in the tower "there's a plane there",
>but it doesn't say which plane it is.

This is what we call Primary Radar. We transmit energy while the
antenna is turning and when this energy hits so many times per scan of
the antenna we get a primary radar return. This shows up on the
controllers scope as a slash mark representing the aircraft.

> The interrogator sends a signal, which
>the plane receives and responds to with an IFF (Identify Friend or Foe in the
>military, I forget the civilian name) code, which identifies the plane. This
>code is displayed next to the radar blip on the tower (or bay departure, or
>the regional center, or where ever) screen, and this is how the controllers
>know which plane is which.

This is known as Secondary Radar or otherwise known as a Beacon
return. The Beacon Antenna is mounted on top of the Primary Radar
antenna so they are both in synch with eachother. We transmitt a
pulse train that Interrogates the Aircraft Transponder and it inturn
replys telling us it's altiude and the Sqwak Freq assigned to it by
the controller. This is how we know what plane(s) we are tracking.
Soon we will enter a new ERA of Secondary Radar called Mode-S that
will do much much more. Where I'm at right now we are installing this
system, however to be in true Mode-S aircraft will have to update
their Transponders.

>So the controller sees a blip, a code next to it, and he tells the pilot
>"radar contact". It's just a fast way to say that he has the pilot's plane on
>the radar screen.

Actually there's a lot more than this. What we do is take the
digitized data from the Primary and secondary returns and feed this
into a main frame computer and the computer correlates this data and
places it on the scopes that controller looks at.
The Primary return is a small slash mark that just kisses/touches the
larger slash mark(Beacon Return) and the Computer displays Alpha
Numeric data at the right place on the scope.

Many other things that the main frames do, but I wont get into that
now! --)

Thought I'd just expand on Dewaynes accurate explanation. The only
reason I know this info is that I work on ALL the above equipment!--))
You'all have a Great 4th of July!

==========

US Secret Service frequencies

(weasel@acca.nmsu.edu http://rever.nmsu.edu/~weasel)

Routine transmissions will probably be in the clear. If the President
is in town, expect transmissions to be DES encrypted (try the local
police departments and media in this event).

Chuck Gysi (scan911@aol.com) has suggested the following for CTCSS-
capable scanners, in order to eliminate receiving DES transmissions:
set the CTCSS tone to 103.5 Hz. This only opens the receiver for
'in-the-clear' transmissions.

I'll be covering a few IndyCar races this summer and I'd like to buy a scanner to take with me. The most popular unit seems to be the Sportcat (SC-150) and I've found what appears to be a decent price at $159. Will the Sportcat be suitable for my purposes? Is there any other model/brand in a similar price range that you'd recommend instead of the Sportcat?

Also, I'll need to buy a headset to reduce the engine noise (I'll have a photo press pass and will be very close to the track). I've seen advertisements for headsets with 25dba noise reduction. I'm assuming they use some kind of negative feedback system but the ad is short on details. Is 25dba noise reduction enough or should I spring for a 27dba unit?

I'm a novice at scanning so any advice on either matter would be greatly appreciated.

The Sportcat is a decent little sacnner for the price...but don't forget
that it's completely unmodifiable for cellular. If full 800Mhz coverage
is important to you, look elsewhere.

I will be going thru Oregon this summer and need something to listen to.
Highway patrol, fire, etc. National parks, Forest service.
I will be in Portland for a few days so if you have a few favorite freqs
there it would be nice, guess Portland went 800mhz trunked, rats...
If you got some good undercover narc freqs, local, state or federal pass
them along. Thanks, Terry in L.A. (qmp@crl.com) WB6QMP

Can you make a TV into a TV station?

I don't think so..

So I don't think you can make a scanner into a transmitter.

Hi Michael,

>I search software for MAC or PC to decode digital signals...
>
>Like POSAG, FSK etc.
>
>If you know where i can found the programms please send me a email..

Courtesy of a fellow Internaut who pointed me in the right direction I found a program called PD.EXE at ftp.demon.co.uk in pub/ham/scanners. Go grab it and have a look.

It will only decode POCSAG 512baud and POCSAG 1200baud and has very limited features but it's the only one I have found so far.

If you find anything else, please Email me to let me know.

AW> I would like info on how I can tune my 43? Also how can you tell when
AW> the radio needs a tuning

If you want to tune your PRO-43, the absolutely best thing to do first is, get the service manual. Tandy National Parts (800-843-7422) can send you one.
As for the second question, that's kinda relative. The proper test equipment will tell you. Also, side-by-side comparison with another '43, using same antenna, good power source, *MAY* tell you.
Doing your own tuning is a job requiring the proper equipment. Doing it by ear, without a LOT of experience, often leaves one with an expensive paper weight.

JT> Does anyone in the net world know of a program I can use with the CT-17
JT> to access my IC-R7100 remotely ?

Sure: ScanCat. I use it for my '7100. I can't locate my manual right now,
but they advertise in most of the scanner mags. Or, someone else may post
their number (hint, hint!).

JT> Why don't ICOM support their OWN product ?

They do, they just don't provide the software to control the radio. This
type of software is a personal thing (I use ScanCat, several of my friends
use other aps, adn don't understand why I use ScanCat. I don't like hte
limitations of their aps, so we use what we like.
Dell will sell you a computer, but let you pick your own database, too.

How's about "select call", not sure of the exact acronym spelling,
possibly "SELCAL". Anyway, the tones that you hear are the selcal code
that is xmitted on a particular frequency that "opens up" the squelch,
basically speaking, of the aircraft's radio that you want to
communicate with. It's kinda like the "phone number" of the plane
that you wanna call.

: >scanning and is not fixed on an active frequency.

: >First, why would it do this? Second, is this common at all, or just on
: >certain types of scanners? Third, is there anything I can do about it?

: The problem is that if you turn the volume on a Bearcat to max. when
: scanning, you can faintly hear the "scanning noise" that the scanner makes
: as it scans. I don't know the technical details of this, but I do know that
: if you have a sensitive VAS then it will trigger it. You can:

: 1. Turn the volume on the Bearcat down to a level where the recorder is not
: triggered by scanning but can still activate on a received signal;

: 2. Adjust the sensitivity of the VAS if possible. This is almost the same as
: turning down the volume of the scanner.

: 3. Try the idea of someone else: attenuating the signal. A previous reply to
: your question will help you here.

: Good luck.
: >Thanks for your help.
: No problem.

I've tried this too, and speaking from experience, it doesn't work. Wht
will work however is this: Get an attenuating cable, hook it to the
headphone jack, and to a stereo, etc. Crank the scanner volume, so it
can be heard, and hook the recorder to the stereo. Use the stereo to
adjust the sound. The cable will cut out the sound below a certain
level. It is also sometimes possible to just skip the stereo and hook
the cable into the recorder, although the recording doesn't sound as good.

>

The main repeater freq. for Shenandoah Nat.Park is 166.900. Most
all of their operations can be heard on the freq. I hope that you can
come down on a clear day. It is quite a sight when you can see 30-40
miles away. But for most of the summer, with the haze in the atmosphere
, it is hard to see more than 10-15 miles.
Enjoy your trip, it is a nice drive. Be sure to take the side trip
up tp Mt. Mitchell.

From: darkstar@sky.net
Message-ID: <darkstar-0507951740570001@dialin-ttys3.sky.net>
Source record: 252939

Can anyone confirm for me that a flame war called "Police radar jammers" took place in this newsgroup a little over a year ago? That flame war ended up in an Internet teaching course (names removed) and it was really hilarious. I also read rec.autos.driving and rec.autos.misc., so it might have been one of those. The discussion ended up onto cats in the microwave,
with such hilarity as "Cats stop working in the microwave, therefore cats are radios," and "Throw a radio in the pool, that makes radio waves." "Throw a microwave in the pool, that makes microwaves." This is not intended to start the flamewar back up, but just to confirm if it took place in this newsgroup!
If anyone wants the transcript and PROMISES not to get mad, e-mail me. It was not vicious but totally funny. No names appear. The lesson was called "So you want to see a real flamewar huh?" and supposedly it appeared in a "relatively quiet" newsgroup, and I remembered the subject and passing up the posts on that subject.

I said > I used to have a GP300 on Ham 220 band.

> Was this a VHF or a UHF unit? What kind of performance degradation (if any)
> did you see? Did you have to reduce xmit power?

It was a VHF unit, I saw no performance problems, but to be honest the
only tests we gave it were soliciting opinions over the air. Everyone said
it sounded fine. It did seem to lose some sensitivity but using the
Motorola BNC adaptor with a Larsen 220 gain duck Antenna cleared that up.
Worked great in short. Sold it, 220 is a great band, but my radios do duty
in many services. I have no business or public safety freqs in that band.
And if I did, it would no longer be type accepted, of course ; >

> Where do you look to see if the pro-43 can be modified. Does
> this mean that no mods can be made to it?

The following applies to scanners marketed in the US and may not be relevant to units imported by InterTan in Canada.

Radio Shack items have a date code in the form 'mmAy', where 'mm' is the month and 'y' is the year (the 'A' stands for A & A Trading, Tandy's import arm). 5A4 or greater indicates an import date after the cellular cutoff.

Radio Shack radios have an FCC ID of the form AAOnnn-nnnn, where AAO is the FCC Grantee Code for A & A Trading and nnn-nnnn is normally the catalogue number of the item. PRO-43 scanners with an "A" at the end of the FCC ID (AAO20-300A) are not modifiable. This does not necessarily apply to any other model.

Unmodifiable PRO-43s have an "A" preceding the serial number. This also does not necessarily apply to any other model.

This posting was brought to you by the letter A.

Can you elaborate any more on how this is done? I'm looking for a way to
do this in my town, but dont know what/where to get a card, what kind of
card, etc, etc. I've heard there's a way to do it with packet radio,
which I have, but dont know what all I need to get it going.

242. BC560/400XLT Memory Dump

Newsgroup: rec.radio.scanner
Date: 1995-07-05 00:00:00 UTC
From: mfetto@aol.com
Message-ID: <3tehq9$set@newsbf02.news.aol.com>
Source record: 252945

The BC560/400XLT programmable scanners have a tendency to dump memory in a mobile environment. I have one installed in my 1994 Chevrolet and sometimes after starting the car all memory is lost.

It has not been determined when the memory is actually lost, i.e.:
a. when the car is shut off
b. when the car is turned on (prior to start)
c. when the car is started
d. transition between "on' and "start"

I installed a 470 uF electrolytic filter cap between the microcontroller and diode with no sucess. Next, I'm going to add a series inductor as the problem may be a spike upon activation of the starter that is hammering the micro.

Any knowledge of this problem and possible rectifications ?

-> I'm afraid your a little off the mark. As a member of the public in
-> the UK The Wireless Telegraphy Act 1949 does not allow you to receive
-> anything other than authorised Broadcast stations, Amateur Radio and
-> CB transmissions together with weather or navigation information WHEN
-> AT sea.

-> The listening to Aircraft (VHF/UHF) is just as illegal in the UK as
-> listening to the Police, Fire, Ambulance, Cellular etc etc.

OH boy! This really isn't my "thread" here, but I had to butt right in.
After reading this, I was shocked all to hell. I did not realize
that this was the case in the U.K. And, I can honestly say, that as an
AMERICAN (U.S.A.) I can now understand WHY George Washington made his
stand against England! It's all I can do to swallow this! I can now
see why the American War of Independence came about! AS we say back
home, if you live in a community where the police do *NOT* want you
knowing what they are up to, YOU SHOULD MOVE!
I will never look at a 4th of July celebration in the same way again.

Chris , there is a trunked EMS system but I can't receive it from where I am.
Yes the freqs are up do date! MTA is the transit authority who police
the subways. In my opinion, the freqs I have listed are the most
interesting. There are tons of freqs for New York however.

Frank.

: really nothing new unless you plan on using the HB 232 for a computer
: interface. With the OS 456 out there I don't see the need for the HB
: 232.

Okay, I seem to remember hearing awhile back that there was a version
of the HB-232 interface available for the PRO-43. I haven't heard anything
about it lately, so my questions are:

1) Is this true?

2) If so, are they still available? Where?

I don't want to make a big deal about this, if everyone else wants it, fine. What I object to is the use of this newsgroup by a commercial organization to hawk its products. This pretty much runs counter to what newsgroups are all about. That's why there are so many newsgroups that are strictly geared to selling stuff. I certainly don't object (quite the opposite) to individuals posting stuff for sale here. I don't think telling people not to read something that really doesn't belong here in the first place is really satisfactory.

> "You can sit here in the waiting room or wait here in the sitting room."
> CHMSAM@aol.com(C. McMaster)

Sorry to disabuse you. While you are more or less right about electron
speed (they only move at the speed of light in a vaccuum). The relevant
speed issue is not the speed of electrons but the speed at which the Phase
Locked Loop (PLL) can lock up (stabilize) on the new frequency. Generally
the closer the new frequency is to the older frequency the faster the
lockup. Whether or not this is used to speed up scanning depends on the
particular model of scanner. Many, if not most, scanners simplify things
by allowing a worst case lockup delay for all frequencies, regardless of
the actual lockup time. The tip off to this is a specified fixed scanning
rate. If the rate is specified as variable then the scanner likely uses
the faster lockup of nearby frequencies to increase scanning speed.
However, the frequencies given in your example are probably close enough
together so that lockup time will not be affected and it is not worth
re-entering your frequencies.

Hi Drew,
I always wondered about it too. I do not think it is possible just to
enter the freq and listen to it on manual. I usually program the freq on the
monitor bank (1-10) to listen the new freq. That way, the scanner scans the
channel in the same way as on manual, ie on saving power by checking the freq
every 2 seconds.
Hope it helps.

: worth buying? I have a Pro 2006 and was planning on doing a little work
: on it. I have the first two and was planning on doing several of the
: projects. Should I get this one too?

Hi Grant!

I wouldn't recommend the book that Bill Cheek has put out at all. All the mods are available elswhere (like the Internet, packet radio, etc.) for nothing and you are more likely to find new and up-to-date modifications that are devoid of errors. I noticed in one of Cheek's books that all the mod's had a disclaimer under them. I think that should tell you something.

Also, Bill Cheek's behaviour on the FidoNet Scanner group is digraceful , disgusting and disrespectful so I would strongly discourage anyone from purchasing any his products. Cheek clearly has a problem with certain minority groups as well as anyone politically left-of-center. If you do, decide to purchase one of his products, I sincerely hope that you don't have any problems with it.

Cheers!

Andy

The feedback type of noise reducing head sets dont't handle the high
frequency noise in automobile exhaust very well at all. The best bet
is to buy a pair of ear muff type construction noise protectors and
put a cheap set of earbuds or headphones inside them.

279. Re: North Jersey Freq's (Long)

Newsgroup: rec.radio.scanner
Date: 1995-07-05 00:00:00 UTC
From: ar148@FreeNet.Carleton.CA
Message-ID: <DB8KLC.G2L@freenet.carleton.ca>
Source record: 253058

Are the frq's for New York City up to date? I'll be travelling there in 24 hours, and I'd love to use them, but I would have thought that there would be more of them, if not a completely trunked system.

For example, if MTA is equivalent to EMS or ambulance, how do they serve 5 million people on one channel? It would be great if all those were accurate, though. (Not meaning to suggest you don't know what you're talking about) I thought I heard someone on another group (or this one) complaining that the new trunked system in NYC didn't work worth a ... well you get it.

Thanks !

Both ScanCat Gold and ScanStar can control the Icom 7100.
We carry ScanCat Gold as do other dealers.

You should be able to order this from AOR in the U.K.;
I'm pretty sure that AOR has a German distributor as well
but I don't know the name.

Colliers Foundation (?) operates a pair of immaculately restored warbirds
and is touring the country with a B-17 and a B-24.

They fly in formation when they go up.

Comms were on 122.675 this past weekend.

287. cordless from miles away (more info)

Newsgroup: rec.radio.scanner
Date: 1995-07-05 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <5JUL95.14141460@shrsys.hslc.org>
Source record: 253066

Just a quick update on my original post regarding this subject. I've received numerous responses and it seems quite possible to hear a cordless from 2 miles away. Especially if the owner upgraded the phone's antenna setup or if they live on a higher elevation. For those who were curious how I *knew* the location of the cordless person...She was giving directions to her home to a person in a car who was driving to her location at that time. The cordless person indicated she was home and was expecting the car phone person within minutes. I felt it was more likely I was hearing the cordless from 2 miles off than I would be hearing cellular on a cordless frequency. Hope I was right about that! On a related note...I regularly hear a guy speaking to nice sounding lady living in England. I'll bet in this case however I'm picking up *his* cordless! :-). As before, I naturally come upon these frequencies by accident...Phil

NiMH batteries tend to have a very high self discharge rate. If you want to use them every day and charge them
about weekly, then they would probably work fine. If you didn't plan on using the scanner that much, you would
probably find your batteries dead when you went to use it. Also, I would not use "Gold Power" (Gold Peak - GP)
NiMH batteries, they seem to be worse that other brands.

I have the TV converter and have never had much luck with it. I saw a thread a while back saying that the R7000 just wasn't up to the task of decent video demodulation. Pictures are usually quite fuzzy (although I was using an omni antenna with pre-amp).

I would like to hear other's experiences with TV and the R7000.

I guess what I'm saying is don't spend too much time or effort getting the R7000 to decode TV signals.

Another thing to consider is this is the season for sporadic e-skip a time when the east coast can talk to Europe and Africa of 6 meters (50 mHz) not far from the 49 mHz of the cordless phone. E-skip is not very power dependent ie. if the band is in almost anything will get you there.

Hey Drew!

I have a Pro-62 by Radio Shack, and had the similar experience as
yourself. Here's what I did:

First, I found the local weather frequency that broadcast's
continuously in my area (I used this frequency to test so
I didn't wonder if it was not working or if the freq was
devoid of traffic).

Press the manual button (to stop scanning)

Type in a valid Frequency (in this case the weather station)

DON'T press enter

If it works, the weather station should be broadcasting!!!

Good Luck! I hope this works?????

Bye the way, I am new at scanning, so don't be dissapointed if this
doesn't work........

I have read through Cheek 3: The Ultimate Scanner and did not think it to be worthwhile especially if you have the first two books. There is really nothing new unless you plan on using the HB 232 for a computer interface. With the OS 456 out there I don't see the need for the HB 232. I am not sure why Bill wrote this book it seems to be more of an ego trip than a scanner book, in my humble opinion. The copy I recieved was for review for the Minnesota DX Club, I.m glad I did not have to pay to see it.
This should raise some dander! Any other opinions of Cheek 3 out there?

Greg Renner
Secretary of the Minnesota DX Club
Opinions are mine and no one elses.

<

I have been listening to the latest mission on 147.5700. I got this from the local radio club, but I really don't know where the transmission is coming from, or if it is a local frequncy only. Nasa is in nearby Houston, 80 miles. I do know that the same transmission that CNN has been broadcasting is the exact same signal that I have been listening to.

Good luck!!

I see in the latest issue of MT that a company is advertising a POCSAG/GOLAY decoding 'kit' for the PC for $100. Is anyone aware of any shareware/freeware/pd software that will do the same thing?

Also, does this new decoder use the same HAMCOM type interface that many others seem to be using these days?

Source record: 252887

One way to get the "not found" message is to scan a bank with the scan mode set to a mode that is not present in that bank. This sounds much more complex than it really is. For example, suppose you had a bank that only had AM as the mode for each memory location. This would be typical if the bank held shortwave frequencies. If you program the scanner to only scan NFM, it would give you the "not found" message. You would program the scanner to receive only NFM by entering FUNC SCAN <down> <down> <down> <down> <down> then twisting the rightmost button until NFM was displayed.

Hope that wasn't too long winded.

309. Re: Secret Service freqs

|
| Can you elaborate any more on how this is done? I'm looking for a way to
| do this in my town, but dont know what/where to get a card, what kind of
| card, etc, etc. I've heard there's a way to do it with packet radio,
| which I have, but dont know what all I need to get it going.
```

Forget it. First of all it's highly unlikely that the media receives MDTs. Most MDT dispatched calls are selective meaning only the unit responding receives the traffic. No other MDT's will receive the call. Usually the press learns of an event through the regular voice channel which usually becomes quite active when units arrive on scene. The press can buy and have programmed radios that will intercept police communications with the proper permission. Transmit is always disabled and the sensitive stuff is not programmed in. For a trunked system only the police radio shop (or their authorized dealer) can program the radio to follow the talkgroups.

As far as monitoring most MDT systems such as Motorola's or GE's, forget it. They both use different proprietary protocols for data. A regular amateur radio packet system will not do a thing. Anybody developing an MDT decoder will likely be sued for patent infringement.

Some small town forces are using slightly modified amateur gear. I believe that Kantronics is selling to the commercial market. You could possibly monitor this but I believe that encryption is an option on these units.

Can some one, please let me know what MODE WWV is broadcasted in.
Also what is the frequency of WWV in Canada. Frequency, and mode
please.

WWV is in AM....on 2.5 5.0 10.0 and 15.0 MHZ. CHU is the canadian time
station at 7.333 and 14.670 (i think) it too is AM

CTCSS....Continuous Tone Coded Squelch System. Sub Audible
tone(frequencies below the normal range of human hearing) which is
generated whenever a radio, so equipped, transmits. This, in turn,
activates a circuit in CTCSS equipped radios which allows the audio to
pass through to the audio (speaker) amplifier portion of the radio. By
the way, the FCC also says that you must be able to defeat the CTCSS (or
DPL "digital private line") which MOTOROLA calls "PRIVATE LINE" (PL) to
make sure that you "monitor" the channel for activity before your
transmit.

Message-ID: <1995Jul6.195620.12591@roper.uwyo.edu>
Source record: 252900

While monitoring the 46-49 band, I noticed that the signal strengths on base and handset freqs vary considerably. I understand that the handset emits far less power than the base. What surprised me that the signal strength from the base was not heard at all while the one from the handset was monitored loud and clear. The source was from the next door neighbor.
Could anyone explain how could this happen?
Thanks for your consideration.
Bishwa Shrestha

Go> Canada so I should be a bit smarter on the laws related to cellular
Go> monitoring north of the border.

Go> Can anyone post the portion of law that applies?

I'm in Toronto, Ontario, Canada.

Your best bet for getting absolutely accurate information would be to
contact Industry and Science Canada (formally the DOC) or the CRTC,
both of which are in Ottawa. They are our equivalent to the FCC.

It is legal for us to listen to cell frequencies. It's just illegal to
make use of what's heard, and these laws and their penalties were
changes a year or so ago. And it's because of this that you should
contact the governing body.

324. Re: Help with PRO-2004 CPU

Newsgroup: rec.radio.scanner
Date: 1995-07-06 00:00:00 UTC
From: RA3325@email.sps.mot.com
Message-ID: <RA3325-0607951126060001@222.21.248.113>
Source record: 252903

I had an inordinate number of problems with my 2004. I got it from a friend who had it for about a year. During that time, he sent it back to the factory a number of times. No luck. It would work a while and die again. He sent to a place called the "Solder Pot" and they "fixed" it. No luck. Died again.

After I got it, it seemed to have a thermal problem. I would open it up and the problem would go away. I finally chased it down to the mother-board. The circuit board feed through connections were not formed well (i.e. the copper did not go all the way through to the trace on the other side. I soldered every connection on the board and replaced the antenna coaxial fitting while I was at it. It has all of the usual modifications for extended channels, scanning speed, the Australian mod, etc.

I have been using it for about two years with no problem, other than the empty channel switch. It doesn't seem to realize when someone is talking and will bypass the channel as if it was empty. Other than that, the radio works fine now. I did add a resistor in the dimmer circuit to make the control panel darker at nite. It would light up the bedroom when on dim. That's it.

Product: Realistic Pro-39
Purpose: Restore full 800 Mhz continuous coverage

Modification is from the January issue of Monitoring Times- January,
1993-page 107

** Warning...This procedure may void your warranty.

** Do not attempt this modification unless you are familiar with small
component soldering. Performing this modification is done at your own
risk.

** This modification restores certain portions of the 800 Mhz band that
is against U.S. federal law to monitor.

A fine tipped soldering iron, desoldering wick, small Philips screwdriver,
long-nosed pliers and rosin core solder are required to perform the mods.

1. Remove the battery door, holder and batteries from the unit.

2. Remove the four screws from the back of the scanner and carefully lift
the back off.

3. Unplug the two wiring harnesses at their connectors and remove the six
bright colored screws holding the circuit board in place. Unsolder the
ground wire from the lower right corner of the circuit board. Unsolder the
two wire connections from the BNC antenna connector at the board.
Carefully lift the board (grasping it near the Molex connector) and set it
aside.

4. Remove the two bright colored screws from the next circuit board.
Carefully unplug the two-wire connector. Unsolder and lift the
rectangular metal shield exposing the diodes.

5. Carefully unsolder and remove diode D6 only; this will restore the
missing frequencies which can be searched in appropriate 30 khz steps.

6. Reverse procedure to reassemble unit.

Sh> why is it that on certain freq. I can only hear the dispatcher and not
Sh> the cars?

Your antenna may not be high enough to receive the mobile side of the
transmissions. The base side will have an antenna mounted up high to cover
the area so that all mobiles can receive transmissions and vice-versa.

I used to have this problem with my local PD until they moved to a
central dispatch agency that uses mobile repeaters.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as

identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-26 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high

frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains

detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their | operations with their assigned call letters either | automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available |
from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association *

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, |
about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business,

sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA |
P.O. Box 2681 |
Glenview, IL 60025 |

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave. |
August 19
October 14
December 16

Bring a notebook. |

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel

(e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542

Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist

called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to

determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their

transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 110 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a
mobile or base model. Portable scanners are subject to
more physical abuse and many have been dropped. If a radio
has been dropped, the laws of probability dictate that the
first point of impact was probably a corner, so be sure to
examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration,
dust, and temperature extremes. This shouldn't dissuade
you from buying a used mobile scanner, but be aware of
possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single | conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC860XLT (Uniden): 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna.

BC9000XLT (Uniden): High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems.

BC100XLT (Uniden): Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no

800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered

different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to

operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO-2035: Radio Shack's 1995 top of the line 1000 channel base scanner. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna.

PRO2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High

synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging

interference in 170 MHz range. Audio suffers from small speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43.

PRO43: Good portable 200 channel scanner using up conversion. Covers military air band. Selectable AM/NFM modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

In Canada you are able to listen to what ever your scanner or radio will
receive. However the law states that you are not permiteted to repeat what
you hear unless it is a Distress call, Addressed to all Stations, Broadcast
on the general broadcast bands such as the local television station, or it is
a broadcast on the Amateur radio bands.

I don't know the exact wording of the law, but it does say basically what I
have said. If you want more I would suggest that you contact Industry Canada
to get what you need

What seems to escape you (and most Americans on the Internet) is
that these echos get sent all the way around the world. I expect that
99.999% of the people who have to download your adverts in their mail
packets would never in their entire lives find themselves anywhere near
your store to buy your bargains.
There are probably thousands of businesses around the world that
have as much reason to post ads here as you do, yet if they all behaved
like you, there would be effectively no rec.radioscan to read; it would
just be one irrelevant ad after another.
The only way these usenet groups work is if everyone follows the
guidelines applicable to each group. The only reason you can post your

ad here is because noone else is doing so. If we all did it, this group would no longer function.

I find your attitude very ignorant and shortsighted and, sadly, a sign of what is going to be happening more and more in the future as more and more people with no understanding of the Internet gain access to it.

Sorry if this sounds nasty, but I've been following this thread (because I have to download it every day with all the other postings) for a while and am getting sick of it.

By the way, I am in New Zealand. Maybe you would be interested in the junk for sale down the road here in Wellington? Shall I start posting a list with prices? Maybe someone in Warsaw could do the same? And how about a dozen radio stores in Kopenhagen? We could all start posting our price lists here. Wouldn't that be great?

That is why we have rec.radio.swap. By not subscribing to that group, I make the choice not to read ads like yours. That is how the system works. Your idea only works as long as only you are doing it and everybody else is polite and doesn't. It's rude.

And just because some guy like the one at the top of this post doesn't mind, that doesn't mean its allright. Surely the number of "Re:Bobs Bargain Bin" postings you are generating should indicate to you that there is something wrong?!
If you post in the correct group, I'm sure you not get a single flame.

Whatever...

Cya, Rob

Sorry to prolong this everybody, but seeing as I usually just lurk and I was getting irritated with this I thought I might spend a Kbyte or two and have a go.:-)

According to Cheek 3 the CE 232 (no longer called the HB 232) works on the PRO 200X series of scanners and he needs to be contacted in person for the CD 232 use on other scanners. Now if you read chapter 1 of Cheek 3 contacting him is no easy task, so I do not know what all that means or how easy it is to hook the CD 232 or a modified version to the PRO 43.

>loker@tenet.edu

My understanding is this... 144-148MHz is 2 meter amateur radio so
this is a rebroadcast on a ham repeater. The source of the
rebroadcast is NASA Select, NASA's public access Satellite TV
channel. I don't know if CNN uses the same video from NASA Select
during launch & landing but they certainly get the audio from it.
So this is also where the ham repeaters get the audio from. If not,
they are getting the audio from a shortwave ham radio station that
is rebroadcasting NASA Select audio only. For shortwave try these...
20198 NASA
20186
28650 Goddard SFC
21395
14295
7185
3860
28495 Johnson SC
21350
14280
7227
3850
All in KHz and USB commonly
There may be exceptions where ham repeaters get audio that is not
directly or indirectly from NASA Select but I don't know of any.
NASA operated a station at Edwards in CA on 169.400MHz that was NOT
from NASA Select but direct. It had no press conferences was basically
the only difference. As far as hearing anything directly from the ground
or shuttle, they use mostly TDRS satellites so their not aiming their signal

at the ground and the frequencies are pretty high. I have heard however
that 296.800 & 259.700 have been active this flight but I suppose
only sporadically and only when their over a tracking station or Texas
or Florida, maybe California. I also show for the houston area,
146.640 & 171.150MHz The 171.150MHz is NOT an amateur repeater but
is owned (or licensed to) the US Gov't so it may be a direct retransmission
rather than NASA Select audio like the one at Edwards. Both of the
last two frequencies are from Johnson SC.

Good luck

You may devise modifications to suit your own application.
I was given a very dead PRO-2022, repaired it, then made a
few changes:

- Added low level audio output jack on rear panel.
This connects to a modified baby monitor transmitter
which repeats on 49.875 MHz whatever the PRO-2022
hears.

- Added a toggle switch which turns off the display backlight
normally provided by an electroluminescent panel.

- Added a flashing green LED on the front panel which flashes
only when the squelch opens. The LED is stocked at
Radio Shack stores.

- Decreased the amount of hysteresis in the squelch circuit.

Note: Sorry, I haven't written up detailed instructions for some of
these changes. I do have articles for constructing the baby monitor
repeater and changing the squelch.

Source record: 253001

You might check out JVFAX v7.0. The program has wil decode many types of FAX. Including NOAA APT and meteor. These are low earth orbit weather sats. While there are diagrams for "real" fax demodulators, there is also included a simple op amp circuts to recieve HF fax. Also incleded is a simple VCO that can convert WX sat fax into "HF" fax. I am simplified here but it does work. For the last week I have been recieving NOAA 12 (at around 8:00 every evening and "capturing" the image with the simple setup. I am going to upgrade soon. But the simple stuff will work. I use a R2004 with a Radio Shack Diskcone. I have a JFET pre-amp mounted inside right next to the scanner. This is not the way to do it, but even this works(with some noise and poor sinal to noise)
I am working on an antenna to be dedicated to WX sat stuff. It will be a crossed folded dipole with the preamp at the top(where it belongs!)
A typical pass last from 5 to 12 minutes and the thril of directly receiving an image from space is...BIG.
JVFAX is at the oakland ftp site. It is a VERY GOOD idea to get Dr. Tagarts WX sat book from the ARRL. He tells how to do it right.
Again you can do it all wrong and still get reasonable results. BTW A scanner has the wrong bandwitdth. In Narrow FM, the BW is way too narrow. No image will be received in the narrow mode. The wide FM is about twice as wide as needed. This allows too much additonal noise to creep in. JVFAX will work best on a 20MHz 386 or better. (it would lock up constantly on a 286(PS1))
Good luck
Terry

Anyone else monitor the conversations wed 7-5-5 on 262.125???
1 India was the net control with 1I7M and 1I5J and others.
They had radio checks every 10 min and occ'ly passed traffic
(Numbers). Also questioned "are you taking any heat from the
officers over there" and "we are working our a**es off here at
(not sure) Cape or Cap Comm(?)". One station was complaining of
low batteries and also wanted to know if "satcom" would be up
for full 24 hours.
I first noticed traffic about 730p and it was still going on
after 11p. One station mentioned a city but I did not tape
the conversation and missed where he said.
This is the first "clear" traffic I have heard on the "satcom"
freqs in quite a while. I think that much of the traffic has
moved to the new "Milsats" which operate on the SHF band and
always encrypted.
Anyone have any ideas who or where or for what purpose these
tramissions were for????
thanks

bill

It appears to me after reading this net for a while that one of the best scanners around is the Pro-2006. I would like to ask someone to comment on this scanner along with listing the many features that make this one of the best midpriced scanners around. Also, does it have computer control, what frequency ranges does it cover, is it a base/mobile or hand held? What do you like in a scanner that this one doesn't have or does have.

Thanks,
John

It doesn't need to be trimmed. As it's used for receiving, the actual
dimensions aren't *THAT* critical, as they would be for transmitting, where
you are trying to get the absolutely best match.
Simply rotate it 90 degrees (so the elements are up/down, instead of flat),
and it should work great.

Your question sounds like you bought a scanner that does not tune to
anything above 600 MHz. If this is true, there's nothing you can do to the
scanner to change this, except to put a converter on it. Grove sells them.
They bring the 800 MHz band down tot he 400 MHz band, which you CAN tune.
Same thing for any other missing bands. If they aren't there, there's not
much you can do about it.
Nothing illegal, really, as mods are not mentioned per se, just that it
ain't possible.
What model did you get, if I may ask?

Bill has got a point there. I have an April '94 (4A4) pro-46 that
people told me was absolutely unmodifiable. After a more in depth
search and the help of several readers of this newsgroup, (Ahem...)
I was able to find a fairly simple mod that enabled the majority
of the cellular band. It always pays to keep looking. It may be more
difficult to do than before, but I'm sure one of these rocket scientists
will figure it out before too long. Good Luck!

I have heard something similiar to this as well! I live outside
of Toronto, Canada. WHich is well away from ANY town so I doubt I was
picking up intermod/images. And I was using the stock/base antenna
that came with tht radio. The frequency was 131.1250 NOT 131.350 Not
only did I hear BOTH sides of the conversation, but other strange
beeps/tones. Touch tone dialing, which was WAY too fast for any
human, Morse code followed, then the actual conversation. Then more
Morse Code after the conversation was over. I initially thought this
was some type of air-phone, but I remember those being in the 400+ Mhz
range, and the 800+ mhz range. I have yet to hear it again. I have
been sitting on this freq' ever since I first heard this, which
was 2 days ago, and have heard nothing since then.

Johnny

By the way, this wasn't by any chance a woman talking was it? And did
she mention a company name? And then did she go through some type of
phone menu? (to record your message, hit '1' now, that type of thing?)

If you know the name of the paging service which uses 454.0750 MHz in the LA area, would you email me with the name? I'd just look it up in Police Call, but a PC which covers LA is hard to come by back here in Illinois. ;-)

Thanks!

WWV in Colorado transmits in the AM mode. There is also WWVL which transmits essentially just a carrier down at 60kHz. The carrier is modulated in a binary code at a very slow rate and can be decoded to tell the time and some other parameters.

WWV currently broadcasts on 2.5, 5, 10, 15, and 20MHz. WWVH in Hawaii does the same with the exception of 2.5 MHz I believe - memory is a little fuzzy on this.

The time station in Canada named CHU transmits on 3.335, 7.335, and 14.670MHz. The mode used here is a carrier with only the upper sideband. The lower sideband is supressed but the station can still be received in the AM mode.

I would write directly to Perry at:

DataFile
P.O. Box 20111
St. Louis, MO 63123

or he is available on GEnie and maybe CI$
Internet via GEnie should be datafile@genis.com I think
If you want e mail me and I will pass your address along to Perry.

I have used PROBE for a month or so now and really like it. I like
it's ability to import PerCon CD files and it's file handling
capabilities in general. Overall a great program.

>Freqs for DC police or Cap Police?

Some DC police & fire freq's

460.100 - tac channel #1
460.150 - 8th district
460.175 - 3rd district
460.250 - 2nd district
460.275 - SOD
460.325 - Citywide 1 & night simulcast of 1D
460.350 - 1st district
460.400 - tac channel #2
460.450 - 4th district
460.475 - 7th district
460.500 - Citywide 3 & Fireboat
414.850 Secret Service Uniformed (broadcast in clear mostly, sometimes DES)
166.925 US Park Police

also DC Fire on 154.19 (CH1) 154.235 (CH2) 154.280 (CH3 & mutual aid) 154.205 (CH4)

I am doing this from memory so the freq's are good but the districts may be off for the DC police stuff. If you want a very good reference, get ahold of a copy of something called Scanner Master. Lot's of extra info like PL's tac & surveillance freq's etc. You can get it at a place in Vienna, VA called EEB (Electronic Equipment Bank). It's not cheap but it's worth it!

You could also be listening to a system that does not repeat the
mobile traffic on the frequency you have selected. This is common
with the CHP.

I'm not sure if this applies to your situation, however, some systems have separate freqs. for the dispatcher and mobile units. The California Highway Patrol is an example of this. Unlike a standard repeater set up, where both the base and moblile units use one freq to access their repeater and another to receive the rebroadcasted transmition, the CHP uses one freq for the dispatcher only and the other for mobile transmitions only. It is easy to monitor the dispatcher; however, it is next to impossible to monitor the mobile units unless you are within close proximity to them. One way you might be able to tell if this is your situations is that from time to time (especially in an emergency) the dispatcher will remain keyed up even as they are receiving a transmition. It sounds like you are listening to one side of a telephone conversation. Also, the dispatcher repeats the units transmitted info much more often than normal. Hope this helps!!

>Why do most standard scanners not cover CB frequencies??

I have two scanners and the cheeper Netset doesn't cover them. This might be because of the low frequencies or maybe the channel spacing, I'm not sure. Scanners are mainly bought by people whom want to listen to VHF and UHF freqs and although many scanners will cover the lower freqs, because of their design are only really any good higher up the bands.

I had the same problems with my scanner although I have 1000 channels to play with. I don't think it affects performance all that much. Have you tried using the search function of your scanner instead of programing loads of freqs that are very close. I did program abt 100 mobile phones freqs once but found search was more suited to listening to these.

>Drew
>loker@tenet.edu

What your hearing is a re-broadcast of the shuttle comms. The broadcasts are set up by hams, and are (usually) the audio portion of NASA Select Television, 24hr, mission-long television coverage. Some ATV stations will broadcast NASA Select, but it can also be seen on some cable systems. If you've a dish, you can turn at to the correct bird and transponder and watch it.

To get the shuttle (and other spacecraft) directly, I'd check out Monitoring Times (they have a satellite publication and I think it's called Satellite Times) for antenna plans, frequencies, etc.

>in all my hardcopy data and had no luck there either. Does anyone
>have any idea on this one? Thanks....
>
>-Greg

I would check any frequencies marked for "itinerant" (sp?) use. Also look for the frequecies usually designated by dot color, thusly:

151.625 Itinerate - RED DOT
151.955 Itinerate - PURPLE DOT
154.570 Itinerate - BLUE DOT
154.600 Itinerate - GREEN DOT
462.575 Itinerate - WHITE DOT
462.625 Itinerate - BLACK DOT
462.675 Itinerate - ORANGE DOT
464.500 Itinerate - BROWN DOT
464.550 Itinerate - YELLOW DOT
467.850 Itinerate - SILVER STAR
467.875 Itinerate - GOLD STAR
467.900 Itinerate - RED STAR
467.925 Itinerate - BLUE STAR

If you keep these in your scanner, you'll hear loads of low-power (usually unlicensed) users. Interesting stuff.

Regards,

Jay

I had decent success with a VOX-activated tape recorder and a patch
cord between the earphone jack and the mic input on the recorder. You
have to set the mic's sensitivity to LOW, or speaker hiss will keep it
going all the time. In my younger days...:)...I used a setup like this
to check all the cordless phones in my dorm while I was in class all
day.

Hi Bill -

Interesting adventure you've got with newer R-1 and "certain
frequencies". Do you have any other improvements up your
sleve for this radio? I bought one a long time ago, through
a non-US distributor, and am not especially happy with the
performance (nor the language in which the manual is written!)

If you've got some selectivity improvements you might be able
to keep your shop working overtime for a while!

THnaks!

Al

The electroluminescent(EL) panels do seem to be life limited. I have designed several circuits that use them and some of the prototype units that are used almost every day are starting to dim at the edges of the display. The life seems to depend on the AC voltage that is provided to the EL display. Higher voltage means higher brightness and shorter life. The display in my prototype is about the same size and brightness as the one on the RS Pro 2006 and it took about 10 to 12 months of 3 to 6 hours of daily use before it started to dim. I also have a Pro 2006 and a Pro 2020. The 2020 was used sporadically for a couple of years (my R7000 is the favorite) and does not seem to be showing any ill effects (yet). I am glad that the 2006 has a switch however, and since my experience with my prototype display, I keep the 2006 display turned OFF almost all the time!

You need a copy of the ScannerMaster Chicagoland Communications Guide. It has all the freqs, PL tones, channel plans, radio codes, and beat maps you could ever want in Chicago, the suburbs, the rest of Illinois, and the surrounding areas of Indiana and Wisconsin. Also available is the Chicagoland Pocket Guide, with the entire Metro area in a small book just right for the glove box.

Available from ScannerMaster Books (of Monitor America fame) (800) 733-6701.
Call the CARMA (Chicago Area Radio Monitoring Association) BBS at (708) 852-1292 300 to 14.4, 8N1

The quick and dirty answer is to remove all the circuit boards down to the base board. There you will find a shield box. Remove it and find diode D6 and clip it out.
This only takes moderate skill unsoldering and resoldering. (I did it without destroying the darn thing). Careful though. I've read somewhere that only certain serial numbered units can be modified and I don't know what happens if you try to modify the other kind.
My mod worked fine but I don't listen to cellular 'cause its against the law don't you know.

I've been thinking about getting a freq counter.....

I know there's a couple companies in nuts n volts that go from around
$100 to several times that.

What I'd like to know is how the radio shack $100 one compares? I don't much
care about measuring operating freqs from any distance, but need accuracy
of around 10 hz out of 5 mhz to setup my satellite receiver's inards.....
you gotta accurately set the video crystal's trimmer cap, or the sync-restorer
doesn't work quite right...as an example......

For a DTMF decoder that can be connected to a scanner (which I know, because I'm doing it):

Motron Electronics
310 Garfield St, Ste 4
Eugene, OR 97402
800-338-9058

I am using the TDD-8X, about $60. It works fine, and can connect to a computer via serial cable and log the decoded numbers.

They have other dtmf products. Ask for a brochure.

Add a Plectron or Motorola Alert |
Crystal Controlled Monitor Receiver |
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1, Plectron 700 series, | and Motorola Alert Monitor is far better than any consumer | grade scanner and the sensitivity, image rejection, and | intermod immunity is outstanding when aligned properly. The Plectron 500 series is less desireable. *

I use 6 Plectrons in my living room, 7 Plectrons down the | basement and several Plectrons and Alert Monitors stored in | reserve. The basement Plectrons are turned on | automatically when someone walks down downstairs. Power to | them is controlled by modified Radio Shack Safe House | infrared motion detector, originally sold as an intrusion | alarm. |

When a rescue squad member from Missouri advertised a | number of Plectrons on USENET, I bought them -- all 20+ of | them. I fixed and restored each one, recrystalled them on | local frequencies, and distributed them to members of my | scanner club who were glad to get them. |

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique | connectors and are scarce. You can buy them new but it's | much cheaper to drill a hole on the rear panel and attach a | permanent a power cord. Make sure you use a grommet in the | hole to prevent the metal chassis from chafing the line | cord.

Many Plectrons and Alert Monitors were equipped with an | internal NiCd battery pack, intended to power the receiver | if the AC power fails. It's unusual to find a used monitor | receiver with the NiCd pack still capable of holding a | charge. More often, the batteries have died and the series | charging resistor has overheated and burned. Be sure to | remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Parts for Plectron receivers are available from:

Plectron
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-2877

I currently have no Plectrons or Motorola Alert Monitors | for sale. I'm hoarding them. :-)

I would check the nationwide "junk" frequencies first, 151.625, 154.57,
154.6, 464.5, 464.55, 469.5, 469.55..... also couldn't hurt to check the
GMRS frequencies, they are often abused by such groups...

Good luck!

Grove Enterprises is now able to do cellular modifications on the R1 scanner (the new models). We are currently working on the modification for the R100 and R7100. If you have one of the new models "non-restorable," we can restore the cellular for $40 (plus shipping and handling). However, if you buy the R1 from us, we can't modify it when you buy it from us, you have to send it back to us after you order it (FCC regulation).

Thanks!

In a few months, Grove Enterprises is going to begin offering shielding for your radio and computers. This shielding will reduce the amount of radiation emittied from your computer and recieved by your radio so that you can better interface the two technologies. For more information, please call 704-837-7081.

Anyone know where I can get my hands on a technical break-down of
POCSAG, Super POCSAG, and GOLAY paging signal format? I am an engineer
who has an interest in scanning and would like to be able to decode these
signal. I have seen some the the tone decoders currently on the market,
but would like to try to build one myself for the educational value of
learning how the protocols for these signals are made up. The main areas
where I am lacking any good information is GOLAY but could still use some
good solid technical literature on the others also. Any help would be
greatly appreciated.

Suggested list price on the DS8000 is $129.95 and it will soon be
available (1-2 weeks) through dealers who carry AOR products.

I don't know what mode off hand but I would like to know if there are radios that will recieve it and set it's own clock by it or better yet another clock by it. Like oh let's say hook the radio to a computer and have the radio pick up WWV and set the computer's clock. Are any of these radios kits to build at home? I'm tired of calling Boulder CO once a month.
Thanks and
Happy scanning

>Thanks for your consideration.
>Bishwa Shrestha

Hi Bishwa. My guess (and I do mean guess) is that although the base is usually more powerful of a transmitter of both sides of the conversation, the handset was probabally closer to your reciever as you accidentally overheard the signals. I've heard of this before...

Just last night I was telling my wife that I heard something strange.
I said I was listening to my ham radio (on 146.520MHz) and heard
some, "truckers," having an intelligent conversation. Background;
I told her this was, "strange," because on a recent trip she was
the subject of some typical perverted, "trucker," abuse from
some guys who saw more than they should have when looking down
through our sunroof. Well anyhow it was refreshing to hear some
more intelligent conversation from the professional drivers.
I don't know how active other areas are but I live on a major
truck route, I80.

441. Bewildering observation, please help

Newsgroup: rec.radio.scanner
Date: 1995-07-07 00:00:00 UTC
From: drchem@iastate.edu
Message-ID: <drchem.805114701@du81-01.cc.iastate.edu>
Source record: 252858
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

Here's an observation that really bewilders me. When I used a shielded
cable (I've tried 3) to connect between the line-out jack
(not the speaker jack) of my Icom R1 communications receiver to the microphone
jack of my tape recorder, recording takes place with intermittent hums
ie. recording is bad, or there is no recording at all. (The shielded
cables all work with the speaker jacks for recording, so there was
nothing wrong with them)

But when I use 2 simple straight wires, the recording is perfect.

The technician at Icom told me the line-out jack was made for recording
with a tape recoder as I have used it and that that any kind of wire
should suffice.

Does anybody here have have any clue as to what's going on here?

Thanx in advance,

Andy Heckman

SchneidC <schneidc@aol.com> wrote:
:Any help on these freqs statewide...and perhaps counties from Walsenburg
:northwest to Aspen?

Here is a really good list for the entire front range, including
statewide CSP.

Denver/Eastern Front Range/North Central CO Expanded Edition 9410

Scan-list 9410 Volume 7 #4 COPYRIGHT 1994 The Metro Comm Center/Phil Mangone.
All rights reserved. Updated 10/12/94 for Denver and the Eastern Colorado
Front Range.

Distribution of this list is at no charge and courtesy of this BBS
from the The Metro Comm Center. Use of this on-line publication for monetary
gain or republication without permission of the Author in part or whole is
prohibited.

Updates to this list and other frequency lists are available for down-load
from The Enterprise BBS @ 659-8294 for the metro area and 785-0217 for the
Greely/Longmont/Ft. Lupton area, The King's Market BBS @ 665-6091 for the
Denver Metro area and Longmont, 225-3491 in the Fort Collins/Loveland/
Wellington area and 346-3491 in the Greeley Area. Please send all e-mail
correspondence to me through either of the above listed BBS systems.

Use of this information in the commission of a crime is prohibited
and prosecutable by Local, State & Federal Laws. I do not assume
responsibility for misuse of this information.

Due to the nature of Public Safety Communications frequencies and use
are constantly changing therefore I do not assume responsibility for
changes, incorrect information and omissions. Use of this list is to
enhance one's use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning
laws within the state of Colorado. However due to 'home rule' jurisdiction
allowed by the state it would be wise to check on local regulation in your
area.

I do not encourage anyone to "Chase" calls as you are asking for trouble
with law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e. F-1 is the same as channel 1.
###.##### S Indicates non-repeater use. Both base and mobile stations
use the same Frequency Commonly referred to as "Simplex"

PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Control etc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems
for "Input Scanning"
IFB Interruptible Feed/Fold Back. TV audio feed for reporters.

NOTES FOR OCTOBER:

AURORA 800:

On October 10th Simulcasting of the two dispatch groups and the Services Group on the old UHF radio system were discontinued. The Aurora Fire Department will continue to simulcast their dispatch group on 154.400 until completion of their new fire station signaling system.

DOUGLAS COUNTY FIRE:

The changeover for all of the agencies that are dispatched by the county is completed. To our knowledge all Douglas County Fire agencies except Parker and Louviers ares dispatched by the county on 151.115.

DENVER 800:

Same old same old. Intermittent crashes, consoles failing and four letter verbs over the air about system manager failures. Time to string up the equipment manufacturer in my opinion.

TANDY NEWS:

As if it were not commonly known Tandy Corporation [aka Radio Shack] had to pull all their 800 MHz scanners that were manufactured by uniden after the implementation of the TDDRA in April because of a factory test mode that included one of the Cellular frequencies announced the PRO-51 should be back in the stores this month. Tandy also released the PRO-2035 the 1000 channel successor to the PRO-2006. There have been mixed comments about the new scanner and complaints about the setup of 10 banks of 100 channels that lead to a lot of unused memory locations in cases where a bank is dedicated to a trunked radio system which will at the most use only 20 channels. Otherwise use for blocks of frequencies works well. For now anyway rampant word on the street is that Tandy will be trying to get a 400 channel triple conversion portable out by Christmas.

SEASONAL FREQUENCIES:

With the rapid approach of the winter season on us adding the highway maintenance frequencies can be very beneficial while traveling or on the way to and from work. The Colorado Department of Transportation frequencies are of value when traveling the interstate highways. Here is a listing of the CDOT frequencies used for the Front Range and Summit County. 151.070, 151.085 for the Metro Area and I-70 Tunnel approaches. 151.265 for El Paso County. And 159.045 for Boulder, Larimer and Weld

Counties. These frequencies are allocated statewide so these will be active in other areas of the state. For specific areas look under the area jurisdiction for which you are interested in with frequencies listed as street maintenance or city services.

CREDITS:

Somebody suggested I should do this more often so... Thanks go to Randy Lynch for being himself. Bill Koppleman for spreading the word on this and the echo on the Rocky Mountain Monitoring Net on 147.225 Sunday evenings at 8 P.M. Radar Kessler for the encouragement. Jim at Mountain NewsNet for information pertaining to the reorganized Douglas County Fire communications system and South Metro Fire communciations system. Marshall Barry and Bob Whiston for getting the echo mess fixed. The people who participate in the echo and who corner me in person. And finally you who are reading this and making it worth the effort!

Yo! Andy-Dandi:

Grant Hopper wrote:
GH> I just noticed that Bill Cheek has a new scanner mod book out. Is
GH> it worth buying? I have a Pro 2006 and was planning on doing a
GH> little work on it. I have the first two and was planning on doing
GH> several of the projects. Should I get this one too?

Andy-Dandi Moss wrote:
AM>Hi Grant! I wouldn't recommend the book that Bill Cheek put out at
all.

Oh? Do tell. Why not? Do you have a copy of the ULTIMATE SCANNER?
Or, are you up to your old tricks again? Let's read on and see, eh?

AM> All the mods are available elswhere (like the Internet, packet
radio,
AM> etc.) for nothing and you are more likely to find new and
up-to-date
AM> modifications that are devoid of errors.

Why, Andy, that is patently untrue. "All the mods..." are not
available elsewhere and certainly not "for nothing", for several
reasons. Neither is there any likelihood for finding newer,
error-free mods, either. Sure, new stuff comes around all the
time.....but not error-free! In any event, you won't be finding many
of my mods "newer" anywhere else. You will find my work
plagiarized here and there......

AM> I noticed in one of Cheek's books that all the mod's had a
disclaimer
AM> under them. I think that should tell you something.

Now you're lying. Though it is true that I will not take
responsibility for work performed by others where I have no control.
Do you? In any case, you lied to the fellow. My books do not put
"disclaimers" under every mod. Just a general disclaimer of
responsibility in the front matter and that's pretty well it. So why
are you lying about it? I'd like to see YOU have the balls to write
something and take responsibility for what others do with it. heh
heh.

AM> Also, Bill Cheek's behaviour on the FidoNet Scanner group is
AM> digraceful disgusting and disrespectful so I would strongly
discourage
AM> anyone from purchasing any his products.

From you.....that is to be expected, and is your right, of course.

AM> Cheek clearly has a problem with certain minority groups as well as
AM> anyone politically left-of-center.

Beg your pardon? My goodness, doing a little smear campaign, are we? YOU are the only minority, sexually perverted venereal wart that can be construed as my problem. But I don't have problems, so it's hypothetical, really.

AM> If you do, decide to purchase one of his products, I sincerely hope
AM> that you don't have any problems with it.

He won't. Unless it's a blank page. We've run up on three books with a blank page right in the middle of the action. We do one of two things, depending on what the reader wants: send 'im a clean fresh page, or replace the book. Meanwhile, we've had a confab with the printer and are assurred of it not happening again. That's the only possible problem, really, and it's rare.

448. WWV

Newsgroup: rec.radio.scanner
Date: 1995-07-07 00:00:00 UTC
From: Dominic.Post@143.magsystems.com
Message-ID: <892_9507080048@magsystems.com>
Source record: 252865

TO : ibmdelf@aol.com (IBM Del F)

WWV currently broadcasts on 2.5, 5, 10, 15, and 20MHz. WWVH in Hawaii
does the same with the exception of 2.5 MHz I believe - memory is a little
fuzzy on this.

The time station in Canada named CHU transmits on 3.335, 7.335, and
14.670MHz. The mode used here is a carrier with only the upper sideband.
The lower sideband is supressed but the station can still be received in
the AM mode.

Del,
Raleigh, NC: Thank you for the information about WWV.

For those of you looking for unblocked continuous coverage scanners, I wanted
to share this information with you.

I shopped around for some time, got prices from England and all over Canada,
and found that the best place for U.S. customers is Durham Radio in Canada.

Originally, I got their number from someone else on the net. They are very
helpful and have great prices- especially in comparison to Atlantic SCAM
Radio.
```

Shop around, but check with Durham Radio last... they'll give you the best price.

Also, why buy from across the Atlantic and merry old England? Buying from our neighbor to the north means saving money on shipping and easier accessibility if (God forbid) something goes wrong with your scanner.

When you call, ask for Keith. He's the owner and VERY helpful and eager to please. Tell him that Monty sent you...

DURHAM RADIO
350 Wentworth Street East, Unit 7
Oshawa, Ontario L1H7R7

PHONE: 905-436-2100 Ask for Keith

P.S.- I am in NO WAY connected to this store in the least. I just happen to be a satisfied customer sharing info with others on the net...

Message-ID: <DBCw6w.5vL@ssbunews.ih.att.com>
Source record: 252874

|Grove Enterprises is now able to do cellular modifications on the R1
|scanner (the new models). We are currently working on the
|modification for the R100 and R7100. If you have one of the new
|models "non-restorable," we can restore the cellular for $40 (plus
|shipping and handling).

It's about time; those R7100-2's must have been really, REALLY _HOT_
sellers with the 800-900Mhz band removed. NOT!

Now the BIG question: for those loyal Grove Enterprises customers who
have been eyeing the AOR AR-8000 for quite some time but have been
holding off because of the lack of CMT coverage: are you going to
be restoring AR-8000s at a reduced rate? $40 is a bit stiff for an
apparently simplier CMT frequency restoral... now, if only you could
convince the Rat Shack people to once again start offering user-restorable
CMT capable scanners that meet the letter of the law but involves
minimal effort on the part of RS scanner owners; I'm willing to bet
RS scanner sales have been down since the CMT industry put a kabash
on the cellular-capable stuff, so RS franchises would be thankful
as well... and then there's Uniden, the folks who supported a ban
on 800Mhz convertors...

458. Monitor Pagers for $100

Newsgroup: rec.radio.scanner
Date: 1995-07-07 00:00:00 UTC
From: robert@eden.com
Message-ID: <3tiegl$n0k@boris.eden.com>
Source record: 252875

Has anyone seen the ad in this month's Monitoring Times about a new company that now sells a program (on a 3 1/2 disk) and a cord that goes from the RS232 port on your computer to a 1/8" plug on the earphone jack of your scanner to monitor paging signals. It gives you the capcode and whatever data (name number etc) that is sent over the pager.

Previously I was only aware of a special type of receiver costing approx $500 that would do this task.

This company charges around $100 for the program and cord. This seems very reasonable. It's called L&K Communications. Does anyone have this?

462. SWAP: RS DSP for Grove Shortwave Scanverter

Newsgroup: rec.radio.scanner
Date: 1995-07-07 00:00:00 UTC
From: bodoh@dakota.net
Message-ID: <3ti9jv$g6c@westie.mid.net>
Source record: 252909
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.shortwave

I have a like new (with box, etc) Radio Shack DSP that I
would like to trade for a Grove Shortwave Scanverter box.

The Scanverter box I am looking for allows you to tune shortwave
broadcasts on a scanner. I would accept either of the two
Grove models, but prefer the one that converts to 300 to 330 Mhz.

Thanks...

>How do you feel about one versus the other, now that you've traded?

I use the R-7100 the same ways I used the R-7000: for monitoring,
chasing down interference sources and bootleggers, and as test
instruments. I don't use either much for *scanning* per se because both
contain relays and are relatively slow.

Both are great VHF/UHF receivers but not great scanners (the PRO-2006
and BC9000XLT are great scanners).

I wrote this a few years ago:

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the
older R7000, but the R7100 is constructed using surface
mount parts. Consequently, the R7100 is smaller. A-B tests
indicate both the R7100 and Radio Shack PRO-2006 receivers
are about equally sensitive, and more sensitive than the 6
year old R7000. Both the R7000 and R7100 are much more
immune to intermod than the Uniden/Bearcat 760XLT and the
portable PRO-43.

Many of the functions controlled by separate rotary switches
and potentiometers in the R7000 are controlled by pushbutton
switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was
replaced with 3 indicators on the R7100, a left arrow, a
square, and a right arrow. In my R7100, the square lights
if you are tuned within 2.5 kHz of center of an FM station,
a larger window for WBFM signals. The arrow indicates the
direction in which the tuning knob should turned to center

the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a front panel switch. The AFC will automagically tune the receiver close to the center frequency if you tune near an FM signal. You can watch the frequency change as the AFC steps the receiver in 100 Hz increments (on NBFM). The AFC never quite tunes to the exact center, but tunes within a window set by a difference amplifier circuit, so the station sounds good even though the R7100 is slightly off center frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger draw-

back is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a similar price range, I prefer the newer R7100. Sensitivity aside, both are about equal communications receivers, but the R7100 is a better scanner, especially for finding new frequencies and organizing memory.

Tom, for the frequencies, get yourself a copy of that area's
Airport Facility Directory. It is inexpensive and probably more
accurate than any other frequency book whe it comes to aircraft
monitoring. I know Sporty's pilot shop has them. Let me know if
you need the number.

wfm says:
" Anyone else monitor the conversations wed 7-5-5 on 262.125???
[zap]
" This is the first "clear" traffic I have heard on the "satcom"
" freqs in quite a while. I think that much of the traffic has
" moved to the new "Milsats" which operate on the SHF band and
" always encrypted.

" Anyone have any ideas who or where or for what purpose these
" tramissions were for????
" thanks

I've noticed that the SATCOM freqs have been really quiet also. But, then again things are kind'a quite on the world front these days. Once we get a lot of units back on the air carrying traffic you can count on someone's encryption equip not working and we'll hear more clear traffic.

Nice capture. I'll have to unlock some of the banks and see what else is up...

Ken

Dominic Post says:
" Can some one, please let me know what MODE WWV is broadcasted in.
" Also what is the frequency of WWV in Canada. Frequency, and mode
" please.
" Thank you all,

WWV & WWVH are both AM at 2.5, 5, 10, & 15 Mhz.

Canada's time standard is CHU and if I remember correctly they have an outlet in the medium wave broadcast band as well as (i think) 7.1 Mhz. I may be wrong on that one since it has been a while since I've listened to it.

I'd like frequencies for those cheap 150 Mhz. and 450 Mhz. Business
Band HT's like Radio Shack and numerous other vendors are selling.

You know, those low power cheapie units?

Anybody with the freq's would be appreciated.

-djk

I recently purchased a pre-'95 RS Pro-39 portable. Is there a way to make sure mine is modifiable? If it is, where is a good and relatively inexpensive shop that would do this for me? Can it even be done, or is it illegal? I am asking you because you apparently have my model and you live close. I live in Minneapolis. Thanks in advance and please be frank.

480. Truckers still only use CB?

Newsgroup: rec.radio.scanner
Date: 1995-07-07 00:00:00 UTC
From: schl0062@maroon.tc.umn.edu
Message-ID: <schl0062.38.002913C7@maroon.tc.umn.edu>
Source record: 252927

Hello all,
Listening to the CB my last car trip, channel 19 seemed to be kind of quiet (as it has the last several times I've listened). I started wondering if truckers after all these years have maybe been moving over to a VHF or UHF band somewhere. Maybe a common commercial band frequency?

Anyway, if someone knows of a replacement frequency for old 'one nine', or just has any info on the subject, please post.

Thanks,
Neil schl0062@maroon.tc.umn.edu

A long time ago, I had made a deal with someone who I totally lost contact with.

I have a Radio Shack PRO-2026 Scanner, fully modified, and very nicely tweeked up by an electronics guru. The radio is in awesome shape and includes a rat shack mag mount.

A few months ago (1-2.. MAYBE 3) I had a deal with someone who had 4 SIMMS.... they were 30pins and we were worried about them being compatible with my current memory.

is it you who made this deal with me? I'm still interested :)

Anyway, I'm considering hardware trades for this radio (disk space, memory, and such...)

Replies can be sent to this address..

-me :)

>cons of it and how it performs on long distance listening.

The Create Log Periodic has been around a long time, but there is very
little ever said about it. I contacted the company a number of years
ago and kind of got the ol' brush off when I wanted a good deal on one
to be reviewed and promoted. So one wonders.......... However, I am
pretty sure the sucker will work ok so long as you understand what I
log-periodic is and is not.....

A log-periodic is the discone of wideband beam antennas...yes, it is
widebanded, but its gain will not knock your socks off. You're
looking at 6-8 dB or so after system losses. It may or may not
fulfill your expectations, however.........

There is a much cheaper and easier way to get an idea. Why not
install a potent TV antenna in the vertical plane. Feed it with RG-6
satellite cable into a 75-300 ohm balun matching transformer at the
antenna. Fit a gold Type-F connector at the receiver end with a gold
plated adapter for F-to-BNC.

TV antennas are cheap; easy to install, and have much higher gain than
the Log Periodics....with deeper nulls and a better F/B ratio. Since
most TV antennas are made for VHF-FM-UHF, you're looking at a
bandwidth of 54-MHz to 860 MHz or so. There should be plenty of
overlap at each end, depending on the quality of the antenna.

It would be a less expensive experiment anyway.........

I thought you said you read the book? Nothing new?

> you plan on using the HB 232 for a computer interface.

The CE-232 is not the only thing "new" in the book....if you read it
all the way through as you alleged.

> With the OS 456 out there I don't see the need for the HB-232.

Why not? With Chevvies out there, you don't see the need for Fords?
You go for monopolies, I take it? You're against the Sherman
Anti-Trust Act? The HB-232/CE-232 was on the market before the
OS-456, so why is there a need for the OS-456? Especially when the
stock software that comes with it is not all that great and serves
only as a come-on for the better and more costly baits after the poor
sucker finds out he's -=almost=- operational. You think that is cool?
The CE-232 doesn't do everything....nothing does....but it is
complete. And it is untapped as far as its power is concerned. Do
you know anything about it?

> I am not sure why Bill wrote this book

I am not sure why you wrote this message.....but what's it to you?

> it seems to be more of an ego trip than a scanner book,
> in my humble opinion.

How's that, pray tell? I trust you've done one better? Where can I
buy it?

> The copy I recieved was for review for the Minnesota DX Club,
> I.m glad I did not have to pay to see it. This should raise some
> dander!

Was that your intent....to raise some dander? Why don't you give the
book a thorough and fair review, while you're at it?

> Any other opinions of Cheek 3 out there?

>Greg Renner
>Secretary of the Minnesota DX Club
>Opinions are mine and no one elses.

And, I trust, then, that you feel you are doing a service to not only
the Minnesota DX Club, but also the scanner world?

I recently built an FSK decoder that would take input from the scanner,
decode it and output it to the printer port of the PC.
I haven't really had the time to write the decoding software, but
I snatched some good information about POCSAG and GOLAY from some
Phillips data sheets for some of their pager receiver/decoder chips.
They have a 1-800 Faxback number but YIPES!, I lost it.

The data sheets that I picked up were the PCF5001 POCSAG Paging Decoder
and the UAA2080 Advanced Pager Receiver.

I must warn you that these data sheets are looong - about 76 pages for both.

The phone number on the top of that faxes is 408-991-5065.
You may be able to locate the 1-800 number somewhere on the World Wide Web.
That is where I found it.

[snip, snip, snip]

I bought mine as a kit from "Electronic Rainbow Inc." as a kit. The kit is $39.95, but it requires you to bend microscopic leads on a voltage regulator and a GASFET transistior. Unless you have the hands of a surgeon, I don't advise it. I had a hell of a time. Anyway, they sell the thing (Zapper) fully assembled for $49.95, and unless you make less than $3/hr, you'll break even given the time it could take.

You can contact Rainbow at:
Electronic Rainbow Inc.
6254 LaPas Trail
Indianapolis, IN 46268
(317) 291-7262 or FAX (317) 291-7269

They also sell lots of other goodies relating to scanning, like a DTMF Stand alone decoder, A/D converters, A Direction Finder, FM phone line tappers, just lots of cool reasonably cheap stuff. They even have a VOX circuit for your scanners tape deck for $6.95!

No, I don't work there, so don't flame me for providing this! I do live in Indy though, so I didn't have to pay the $5.00 a pound shipping fee. I play to buy and build several of these little projects in the next year or so.

have fun

I have every registered transmitter in the State, but I'm to lazy to type
them all in. The book you want is called:

Frequency Almanac
Scanner Frequency Callbook
Indianna Master Edition

I have it and it has EVERYTHING in the State of Indiana except the Fed, which the FCC doesn't do. It cost ~ $20. I HIGHLY recommend it. It has been the single most helpful scanning acess I have purchased!

I almost forgot. The frequency of X-Band Radar is 10.520 GHz. It is ILLEGAL to transmit in this range, so I'm not telling you to do it. Just thought it might be helpful to know!

To tune the Zapper to any freq, a spectrum analyzer that handles 10 Gigahertz is really helpful. If you don't have access to one, then tune using a receiver.

502. Re: Create Log Periodic Scanner Beam.

Newsgroup: rec.radio.scanner
Date: 1995-07-08 00:00:00 UTC
From: tubegod@cml.com
Message-ID: <ragnaroek1995Jul8.142104.2304@news2.compulink.com>
Source record: 252783

Bill Cheek (bcheek@cts.com) wrote:

: The Create Log Periodic has been around a long time, but there is very
: little ever said about it. I contacted the company a number of years
: ago and kind of got the ol' brush off when I wanted a good deal on one
: to be reviewed and promoted. So one wonders.......... However, I am
: pretty sure the sucker will work ok so long as you understand what I
: log-periodic is and is not.....

Bill Cheek:

Perhaps Create either a) didn't like your attitude b) didn't feel like
giving you a handout c) didn't like your flagrant use of four-letter
words d) was aware of your associations e) was aware of your dubious
credibility f) simply don't like you g) didn't like your hacks.

Just a few *wild* thoughts!

: A log-periodic is the discone of wideband beam antennas...yes, it is
: widebanded, but its gain will not knock your socks off. You're
: looking at 6-8 dB or so after system losses. It may or may not
: fulfill your expectations, however.........

Given the size of a Log-periodic as compared to a conventional yagi for
the same frequency, the gain of the log-periodic is considerably LOWER.
Hardly likely to knock ones socks off.

: There is a much cheaper and easier way to get an idea. Why not
: install a potent TV antenna in the vertical plane. Feed it with RG-6
: satellite cable into a 75-300 ohm balun matching transformer at the
: antenna. Fit a gold Type-F connector at the receiver end with a gold
: plated adapter for F-to-BNC.

Well, this is great if you want to listen to virtically-polarized TV
broadcasts. However, you'll note that most scanners purposely don't receive
these frequencies at all. Even if they do, how many people regularly
tune to these frequencies? Not many, and besides, the people who buy
scanners do so because they pick up the frequencies that other receivers in
their house dont't.

: TV antennas are cheap; easy to install, and have much higher gain than
: the Log Periodics....with deeper nulls and a better F/B ratio. Since
: most TV antennas are made for VHF-FM-UHF, you're looking at a
: bandwidth of 54-MHz to 860 MHz or so. There should be plenty of
: overlap at each end, depending on the quality of the antenna.

Um, Bill. I hate to be the bearer of bad news but 99% of TV antennas
I've seen ARE LOG PERIODICS. How does a TV log-periodic operated out of
it's optimum band have more gain than a log-periodic used IN it's design
band??!

: It would be a less expensive experiment anyway.....

Well, at least here's some truth to your post.

Have a nice day!

Andy

510. Scanner performance woes

Newsgroup: rec.radio.scanner
Date: 1995-07-08 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DBF0AH.H86@ennews.eas.asu.edu>
Source record: 252791

I know this message is long, but it contains a lot of background information that is necessary for you to fully understand my predicament.

I've been using a Realistic PRO-2028 50 channel dual conversion scanner with no 800 MHZ capabilities for over 2 years. It was pretty inexpensive, and has the expected amount of overload, desense, and intermod. A few days ago, I purchased a Radio Shack PRO-2037 200 channel triple conversion 800 MHz scanner on sale for $200 (regular price $300). I thought I had gotten the deal of a lifetime, until I got it home and turned it on. Its performance on 800 MHz was incredible. Great sensitivity, and not a single image to be heard. Then, I programmed in the VHF-hi frequencies I had been monitoring for years. I heard the strong ones, but the weak ones were nowhere to be found. After a little investigating, I discovered that the 2037 was overloading and desensitizing so badly, that I couldn't hear any but the strongest signals on VHF-hi. I didn't even test the performance on VHF-lo or UHF, but the VHF-air band's noise floor (i.e. with the squelch turned all the way down) was a mix of broadcast radio stations and pagers. My PRO-2028, by comparison, has an almost perfectly silent noise floor.

Stations that were weak on the 2028 were completely obliterated on the 2037, and medium-strength signals which were always clear on the 2028 were lost in the pager interference about 50% of the time on the 2037. I might add that I have also used an old Bearcat 20/20 to monitor VHF-hi and VHF-air, and its performance was almost identical to the good performance of the 2028.

I know that overload is to be expected in a metropolitan area, but when a $300 super-scanner can't hear half of the things that a $120 base-line scanner can, I begin to get dissatisfied. Phoenix's radio systems are 95% simplex, and I also monitor several transmitters that are pretty far away from my location, so I need good weak-signal performance.

Needless to say, I took the PRO-2037 back the next day. On a whim, I then purchased the discontinued PRO-2027 (100 channels, dual conversion, 800 MHz) for $140. I got it home, programmed in the VHF frequencies, and found that the 2027 performed comparably to the 2028 and 20/20 (i.e. only a little worse). Problem solved, right? Wrong. The images on the 800 MHz band made public safety monitoring completely impossible. I know these images are useful for people who want to monitor certain censored portions of the 800 MHZ band, but I am genuinely interested in monitoring 800 MHz public safety. If I am to have any hope of monitoring an 800 MHz trunked system, I can't have the scanner hanging up on images every 5 seconds. As a side note, the 2027's 800 MHz sensitivity left a LOT to be desired.

The PRO-2027 went back the same day, and I am now right back where I started.

Here is my question: Why did the PRO-2037 exhibit such poor performance on VHF-hi and VHF-air? Is it because of the triple conversion scheme (note that triple conversion is intended to eliminate images, not overload/desense)? Is the 2037's front end just poorly designed, or can I expect this sort of poor performance from all triple conversion scanners? Will I have to choose between images and overload?

Has anyone out there found a scanner than performs well on VHF-hi AND 800 MHz, and also rejects images in the 800 MHz band? (I'm used to images on VHF, and I can live with those a lot more easily than I can with 800 MHz images). I was thinking about the Uniden BC-9000XLT, but it is really expensive, and probably won't go on sale the way Radio Shack equipment does. Also, the only place here in town that sells it makes it very clear that they do not sell equipment for evaluation purposes. If it overloads like the PRO-2037, they MIGHT take it back, but I'd be out a 15% restocking fee. I also read a review of the PRO-2035 1000 channel unit, but I couldn't really glean any information regarding its resistance to overload.

Please reply via e-mail, and I'll post a summary of responses to the group in a week or two.

Hi!
Does anyone know of a source for the Uniden MR-8100 Alphanumeric scanner and it's software? I know it has been since discontinued by Uniden with the cell-band et all. If not the MR-8100 is there a similar scanner out there some place that has Alphanumeric display and is designed to be a "commercial scanner" like the 8100? We have one 8100 in our command vehicle and would like to find another unit or something with similar capabilities. The only other Uniden I have found that seems to come close also has 500 channels, which is about 400 more channels than we might ever fill in this rural area. Thanks for any help you can provide.

From: mulligan@ACM.ORG
Message-ID: <3tkq89$9j@hopper.acm.org>
Source record: 252801
Cross-posted to: rec.radio.scanner,alt.radio.scanner

> ... frequencies for those cheap 150 Mhz. and 450 Mhz. Business Band HT's ...

Note that the "J" and "K" dot frequencies are not GMRS, but are authorized
on 12.5 kHz offsets for 2w use in the Industrial-Business service [90.267].
White, black and orange dot freqs. are GMRS.

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Dot Frequencies

Dot color Other
Red 151.625 "J" Dot 467.7625
Purple 151.955 "K" Dot 467.8125
Blue 154.570 Silver Star 467.850
Green 154.600 Gold Star 467.875
White 462.575 Red Star 467.900
Black 462.625 Blue Star 467.925
Orange 462.675
Brown 464.500
Yellow 464.550

"Dot" stickers are used by the manufacturer or distributer to
indicate the frequency of otherwise identical transceivers. They
are often found in rental inventories and on construction sites.
Note that the 462.xxx frequencies are for GMRS.

I don't have the number, and I don't know if there is such an office.
Just call directory assistance for your nearest Canadian city and get
a Radio Shack phone number. That store will be able to tell you all
you want to know.

>Also, does Canada use 120v 60cycles?

Yes, of course we do. We joke about the ignorance of Americans about
anything non-American. I couldn't help but laugh at this question.

>> 2) If so, are they still available? Where?
>>

>According to Cheek 3 the CE 232 (no longer called the HB 232) works on
>the PRO 200X series of scanners and he needs to be contacted in person
>for the CD 232 use on other scanners. Now if you read chapter 1 of
>Cheek 3 contacting him is no easy task,

Sure it's easy. For personal contact, there are only a half-dozen
ways or so. There is one impossible way (voice phone) and one
ineffective way (snail mail). The number of voice calls I get make it
impossible to get any work done, and snail mail is expensive and time
consuming for all parties concerned.

In any event, my business interests capably handle business matters
and I handle personal matters. I am available and generally within
24-hours, if not sooner. I just don't do voice. But people are
available at the voice number so long as only information or orders
are in mind and tech support is not required. I provide all tech
support, and strictly through the various written media, preferably
public like the FidoNet echoes and hopefully these newsgroups
as soon as I can find an efficient news reader/editor. In any case, I
am not at all difficult to reach.

>so I do not know what all that means or how easy it is to hook
>the CD 232 or a modified version to the PRO 43.

It is readily "doable" if one has a decent set of eyes or magnifiers.
Unfortunately, the PRO-43 does not lend itself to 2-way interfacing,
but full Keyboard Control and AutoProgramming by the PC are available
for it through the CE-232.

I have the ICOM TV decoder for my R7000 receiver and it works fine. I
use it for Amateur TV. I receive at 1.258 GHz with a Create Log beam
about 20 ft in the air and the distance to the repeater is about 60
miles. Most of the time I get a fair picture with some snow. I also
receive all the TV channels in San Diego and LA. My R7000 is better
with adjacent channel interference but not as strong a receiver as a
normal TV. Also no comb filter.

>I want to put it up 80 ft on a rotor to listen to uhf 150 miles away.Anybody
>out there have any experience with this antenna that can give me the pros and
>cons of it and how it performs on long distance listening.

I have a Create Log Beam. It is the 105 MHz to 1.3 GHz version. I
have been very happy with it. Currently I have it 20 ft in the air and
vertically polarized. I have really not tried for distance though. I
think that the distance that you would get would depend on the
transmitters altitude. I work Amateur TV on 1.2 GHz at a distance of
60 miles and alot of Los Angeles TV channels at a distance of > 100
miles. These TX's are all at high altitudes.

Hope this helps. Bruce Forsberg WB6IZG

: --
The hum is most likely from oscillation. You may have the shielded wire
improperly grounded. Or you may be picking up interfernce from the scanner.
If the two wires work great than use that. Good Luck, Keith

536. The Ultimate Scanner a retraction of an earlier message

Newsgroup: rec.radio.scanner
Date: 1995-07-09 00:00:00 UTC
From: grenner@ix.netcom.com
Message-ID: <3toqqr$4o@ixnews3.ix.netcom.com>
Source record: 252680

After re going over the book The Ultimate Scanner:Cheek 3 and after some email conversations with the author I would like to point out some errors in my earlier answer to and inquiry. A gentleman asked if he should get Cheek 3 to go with his 2006. I along with one other person replied no.

After further review of the book, my reply is yes. Cheek 3 is a worthy successor to Scanner Mods 1 and 2 with some new information regarding the use of the former HB 232 now referred to as the CE 232. While personally I use the OS 456 by OptoElectronics I have used the HB 232 (as it was called at the time) in another 2006 I no longer own. I purchased mine used from someone who decided he did not want to build the kit. His loss my gain since I got it at a good price. I have since sold that radio. I enjoyed building, installing and using the HB 232 it is a powerful interface

Other comments alluded to the mods presented in all of Bill's mod books being available elsewhere. That is partially true. Cell mods for those scanners capable of a cell mod (a list is provided in Cheek 3) are generally available else where. Generally speaking the other mods are not and unless pirated are only in books 1-2 or 3. As noted before I very heavily used books 1 and 2 to do mods on a 2006 I owned and a 2006 and had lots of fun doing those mods.

If you own a scanner and in particular a RS 200X series scanner than Bill's books are rich with mods. If you miss a company like Heath kit and want to do some of your own building, than this like the others is a book for you.

The initial copy of this book was received by me for the Minnesota DX Club without cost, from the publisher for review. As is club policy this book will go into the club's book collection. I will purchase my own copy on Monday.

Lastly, a point was made earlier not to buy a Cheek book due to Bill's politics. I do not know what Bill's politics are, nor do I care. His politics are not evident in any of his books and a decision to buy one or all of his books should not be based on politics. This is a scanner group,not a politics group, let's keep it that way.

Greg Renner
Secretary of the Minnesota DX Club
Opinions are mine not those of the Club or any of it's members

That sounds like a bad connection, somewhere. Are all three shielded cables
using the same jack (are you MAKING a cable each time, using the same
hardware)? Is there maybe something wrong with the plug on the R1?
There's no reason shielded cable will do this, so there has to be something
else causing this, and it sure sounds like a bad connection.

Any decent voice-activated tape recorder with a jack for a mic- or line-in
should work. You may have to get an attenuated patch cord, or attenuated
plug, from Radio Shack, to remove a sub-audible hum that, on some scanners,
will keep the recorder going all the time.
Hope this helps.

DR> I've been using a Realistic PRO-2028 50 channel dual conversion scanner
DR> with no 800 MHZ capabilities for over 2 years. It was pretty
DR> inexpensive, and has the expected amount of overload, desense, and
DR> intermod. A few days ago, I purchased a Radio Shack PRO-2037 200
DR> channel triple conversion 800 MHz scanner on sale for $200 (regular
DR> price $300). I thought I had gotten the deal of a lifetime, until I
DR> got it home and turned it on. Its performance on 800 MHz was
DR> incredible. Great sensitivity, and not a single image to be heard.
DR> Then, I programmed in the VHF-hi frequencies I had been monitoring for
DR> years. I heard the strong ones, but the weak ones were nowhere to be
DR> found. After a little investigating, I discovered that the 2037 was
DR> overloading and desensitizing so badly, that I couldn't hear any but
DR> the strongest signals on VHF-hi. I didn't even test the performance on
DR> VHF-lo or UHF, but the VHF-air band's noise floor (i.e. with the
DR> squelch turned all the way down) was a mix of broadcast radio stations
DR> and pagers. My PRO-2028, by comparison, has an almost perfectly silent
DR> noise floor.

-+* MUCH DELETED *+-

Dave,
You didn't say what the antenna situation was, but it didn't sound like you are using the whip antenna that came with the scanners. If you are, ignore this.
Using an external antenna here in Phoenix has it's risks, and it seems that you've run into one - desense.
The answer, aside from finding a PRO-2004, -5, or -6, could well be to use a less efficient antenna, or use an attenuator. Radio Shack sells an attenuator for TV use, which works perfectly for scanners, as well. It has F connectors, so connectivity is a snap.

Each scanner model has its own characteristics. Getting one that fits your specific wants can be a chore, as you've found.
Bob Parnass has given high marks to the AR-9000. Personally, I've found the PRO-2022 to be a good performer in the less-expensive scanner class. Dual conversion, but, in my experience (which, I admit, isn'r necessarilly yours), I've had little problems with images in the Phx. police/fire, which I know isn't in the 800 band. Glendale is, though, and I've not had ANY image problems there with the 2022. The 2022 is, as you may know, electronically the same as a PRO-34 handheld, and I've had one of those for years (my first scanner, actually), and it's always been a good performer, too. However, a good external antenna will hammer it with pager signals, worse so than the 2022 (why? I dunno...).

Anyway, you might try an attenuator.

I am no expert, but I do know that the ATS-3 Satelite is used by the American Red Cross in times of disaster, and I beleive they still do a net check on Wednesday afternoons. It is basically geostationary, and roughly speaking it is over Mexico if I remember correctly. If you want to look at it's precise position, you should check around for one of the many Sattelite Tracking shareware programs, that usually come with a recent NORAD element set (the data that defines sattelite orbits). If you cannot find one (I think there was a good one called 'STSPLUS or STSORBIT' around somewhere) then email me and I'll see if I can upload it somewhere for you. Ground stations using the ATS-3 generally use a modified 2 meter ham rig, and need about 100 watts through a 10 db directional beam to hit it with full quietting. I've never tried to scan it myself, but I bet you could hear it with a directional antenna (with like a 20 or 3 degree beamwidth) pointed in the general direction.

I just saw, in one of those mail order catalog's (maybe Damark), a device that claimed to transmit a white noise on X, K and Ka band radar when it receives a radar signal. They advertised it as a 'Radar Jammer' and it sold for around $100. How can they sell that if it's illegal?

I bought the RS freq. counter, and although I only use it up to and through the SMR stuff (900 Mhz or so) it has worked terrific. The slow scan mode gives resolution much getter than you spec'd. For the money, and the convenience of picking it up at the corner store, it can't be beat.

549. FM Radio Bands

Newsgroup: rec.radio.scanner
Date: 1995-07-09 00:00:00 UTC
From: bungalow@works.com
Message-ID: <bungalow-2708561521130001@alamb.tiac.net>
Source record: 252693

I read in alt.hackers that there was a way to mess with an FM radio to recieve broadcasts from Airport Control Towers, and also from sattelites. Here's the message:

Doing a bit of reading, I noted that airports and planes communicate on the FM band in the range of 108 - 130ish MHz. Most FM radios tune FM from 87.9 - 107.9 MHz. Remembering a trick an electronics guru mentioned, I took apart an old FM radio. First I tuned it down to 87.9. Then I adjusted one of the coils of copper wire embalmed in wax. I opened the coils until a local station that broadcasts at 101.7 came in loud and clear. Following that, I turned the dial up until I heard the local airport's ATIS message (this is great because not all frequencies are used all the time. Finding one and fine tuning the radio can be a pain. Also, the ATIS message is repeatedly broadcast all day, which can be a bit annoying after a while). Now, to improve the upper limit of receivable frequencies I would tune down slightly from the ATIS freq. and then adjust a trim capacitor until the ATIS came and went. I repeated this until the radio wouldn't tune any higher. A couple of adjustments to one or two other trims and the radio now pulls in the airport loud and clear.

Now, does this sound feasable? If not, can anyone suggest an alternate method to get the ATIS messages? I would prefer that you email you're replies, I'll get them sooner. Thanks in advance...

>Just a few *wild* thoughts!

Yes, of course. And perhaps you have your head tucked away in a nice,
warm, moist, dark place where the sun has never, ever shown. You
should extricate it before a sudden flatulent explosion jack-hammers
your brains down your spinal column and out the cocyx region......
which would create a classic paradox of the Mobias variety.

Anyone who knows the CREATE antennas knows that they are overpriced;
are not regularly advertised in magazines, especially those "in the
know"; and are never reviewed by leading authorities in the field.
Perhaps CREATE feels as you intimated about EVERYONE and not just
yours truly. Perhaps they have no feelings at all, and simply are
there to make sales to whoever has cash waving in the breeze.

>Given the size of a Log-periodic as compared to a conventional yagi for
>the same frequency, the gain of the log-periodic is considerably LOWER.
>Hardly likely to knock ones socks off.

Log-periodics for 25 MHz - 1300 MHz are......large. The Create Log
Periodics are.....very large. VHF-UHF log periodics are MUCH larger
than their corresponding Yagi equivalents of any gain under 10 dB or
so. Your statement is utterly meaningless and without value.

>: There is a much cheaper and easier way to get an idea. Why not
>: install a potent TV antenna in the vertical plane.

>Well, this is great if you want to listen to virtically-polarized TV
>broadcasts.

What a stupid statement. You think a Create Log Periodic (and a
discone) are not also functional on the TV bands?

>However, you'll note that most scanners purposely don't receive
>these frequencies at all. Even if they do, how many people regularly
>tune to these frequencies? Not many,

And an even stupider statement. What the hell are you talking about?
A TV antenna is designed to cover the spectrum of 54-869 MHz and
most points in between including FM Broadcast. That spectrum also
includes the frequencies of interest to scannists. You are the only

one who said anything about receiving TV signals. Yeah, you can if you want to......but that is moot and off the point of using a TV antenna for scanner reception.

>Um, Bill. I hate to be the bearer of bad news but 99% of TV antennas
>I've seen ARE LOG PERIODICS. How does a TV log-periodic operated out of
>it's optimum band have more gain than a log-periodic used IN it's design
>band??!

Geezus H. Kriste, whatsamatter with you? Contact a TV antenna manufacturer like Winegard or Channel Master and see if you can get boned up and steeped in their technology. Don't be passing off your congenital nescience on me, Andi..... You have no clue as to what you're talking about......and clearly, historically, your mission is to come after me. At least get your ducks in a row first.

>>: It would be a less expensive experiment anyway.....

> Well, at least here's some truth to your post.

There's a LOT of truth to my post, Andi and a whole lot of antagonism and imbecilic idiocy to yours. Go do your homework; grow up a little; get yourself "straightened out"; and come back to task and challenge me when you can make the grade. Tell your sugar daddy to not send a boy to do a man's job.

> GRE0327 is the Mfr. Part number. The RS number is MX-7478.

That's the part number for the EARLY 2004 CPU, but GRE0327A is the later and much preferred one. It allows 30 KHz steps throughout ALL the cellular bands. The early CPU was based on the older, smaller cellular bands of 825-845 and 870-890 MHz. The newer CPU gives 30 KHz steps between 868.95 - 894.0 and 843.95 - 869.0 MHz, and is completely interchangeable with the old one. I know.....

> The 2006 uses a completely different CPU. The 2006 CPU would not be
>compatiable with the 2004.

THAT is not a foregone conclusion. True, the 2004 CPU is a 64-pin DIP style while the 2006 CPU is a 72-pin surface mount type. At first glance, there seems no relationship. But.....if one were to hold the data sheets for these two CPUs side by side, PRO-2004 Service Manual, pages 67-68 and PRO-2006 Service Manual, pages 71-72, it can clearly be seen the following interesting information:

1. PRO-2004 CPU has 62 active pins/functions
2. PRO-2006 CPU has 62 active pins/functions
3. The active pins of each CPU can be correlated to have the exact same functions! Ohhh yessss, baby!

Therefore....if a PRO-2006 CPU is laid out on some sort of a header atop a 64-pin DIP socket and if care is made to match up pin function for pin function, it is probable that it would work. The 2004 resonator should be exchanged with one for a 2006, of course, but that is about the extent of the needed work.......which remains easier said than done, by virtue of the necessary micro-wiring of the header.....

But......it is a fact that Tandy National Parts (800) 442-2425 no longer supports the PRO-2004. So those with dead CPUs are relegated to junking their machines or at least giving the above procedure one helluva gung-ho attempt....and in the process, might well turn their great 2004 into a 2006 upgrade! It may be the only way to keep these old 2004's alive into the 21st century.

However, the gentleman to whom you replied does not necessarily have a blown CPU. Early PRO-2004's were susceptible to defective solder joints at random on their PC board, caused by an out-of-tolerance wave

soldering machine at the factory. If he did not mess around inside the unit to speak of, I might suspect solder joints before brain death.

The procedure you outline is feasible for getting an FM receiver to work up above the normal limits of the FM broadcast band provided you're working with one of the older style analog tuners which it sounds like you are. You might even be able to pull this off with a PLL type tuner but that may be a bit more tricky.

From a practical standpoint your method will very likely not produce the results you're looking for. The reason is that the entire civil aviation band is AM including the ATIS and VORs with an audio subcarrier. You'll probably be able to pick up *something* but whether it is intelligeble is another matter.

It may be possible, if you have the schematics for your particular radio, to add an AM detector (a diode) if you can tap in after the last IF stage ahead of the FM descriminator and then take the output and place it at the audio preamp. But this last part is speculation - haven't been there, haven't done that. Now that you've brought this up, I may try this myself for fun and enlightenment.

>Bill Funk
> Internet: bill.funk@iotp.com

Andrew, here's another theory: Although the line out level is not as high
as a speaker level, it is quite a bit higher than microphone level. Most
line outs are about minus 10 to plus 4 db, or about 700mv to about 1volt,
more or less. The mic level input on your recorder is probably around
minus 55db, which is down around 1/1000 of a volt. So the output signal is
overloading the input to such a degree, that the hum you hear is just the
highly amplified residual noise which comes over any receiver at idle.
Then when an actual signal comes through, the overload is so great that
you get nothing but distortion.
You need a line-to-mic level attenuator. Radio Shack and others sell them,
either as a one-piece adaptor, or as a ready-made cable with the
attenuating resistors built in. Three to five bucks, I think.
Hope this helps.

I'm sellign my Uniden Bearcat 3000XLT handheld scanner. It's got 400 fully programmable channels. It covers 25-550 and 760-1300 MHz. (excluding cellular) of course ;)
It scans at 100 channels a second, it has a scan delay, weather search, 20 priority channels, a light, a built-it 15 dB attenuator, AM/NFM/WFM mode, keypad lock, channel lock and a battery charger. I have added a better antenna which you'll get along with the stock antenna, and an earphone. It's in mint condition and really works great! I paid $389 for it but will sell for $300 or best offer. It's negotiable. Reply to nikkip@freenet.fsu.edu

wired@genes.pl.my (Eugene Kang) wrote:

>>>I was wondering if anyone can suggest a good belt holder for a BC200XLT?

Radio Shack used to sell a scanner that was a Bearcat 100XLT. The RS model had a built in belt clip. Since the 100 & 200 use the same case, I wonder if you could order the rear case & belt clip from Radio Shack?

571. WANTED - USCG Freqs in Tampa Bay Area

>After further review of the book, my reply is yes.

After our heated e-mail exchange, I am not exactly sure why your retraction and change of heart, but rest assurred that I think it took courage and a lot of thought for you to do it. My e-mails were succinct and rather uncaring after a point, and were I in your shoes, I'm not sure I'd have done what you did.

You certainly have my respect and appreciation. Let me add, however, that if I pressured you into any undeserved favorable comment, I would ask that you retract it, too. Never was that any part of my desire. Matter of fact, I've been in this business for over 30-years, and I made a hell of a lot of that distance on critique, not pats on the back. When I do something less good than possible, I appreciate knowing how it can be done better.

This is a good opportunity to elucidate how I draw a distinct line between myself and my work. Me....I am sacred and not subject to anyone's critique but my own. On the other hand, my work is fair game if treated with a modicum of respect and a touch of honest evaluation.

After many years of dogged effort, I have become an honest man and want nothing that's not mine or that I can't get on my own. I have overcome common envies and lusts for other people's property, wives, and fame. If it ain't mine, I don't want it. With that in mind, I will not tolerate being called a criminal or having my motives too seriously challenged like Andi Moss recently did. More on that weenie later in this article.

I have achieved a great balance of freedom and a sense of self-worth and I like me for who and what I am.....which, despite any egotism displayed in my book.....is basically nothing of any great meaning to anyone other than myself. The ego part of my book, which I still think is not all that apparent.....may be there to some extent simply because of the personal and professional gains I have made in the last few years. For instance.....compare the drawings and graphics in my latest book with those in the first two. Take a real close look. The difference should stand up and shout "HELLO!" and blow your eardrums

out.

I -=thought=- the publisher of my first two books would take my cruddy artwork and have it professionally redone. NOT! While my first two books are very good in substance, they are pieces of trash in terms of the ART of publishing. That particular publisher takes less pride in his work than I do in mine, with the result that I had almost no say-so in how Vols 1 & 2 were assembled and edited. In fact, that publisher deleted some of my work and substituted some of his own.

After Vol-2, I knew I had to have another publisher, but what about going from the frying pan into the fire? That was possible. So for three years, I dove headfirst into computing, publishing, grapnical arts, and the sciences of writing books. I was determined to give my next publisher almost nothing to do other than take the manuscript to the printer and then on to market.

The ULTIMATE SCANNER is much more -=my=- book than the first two. Never mind that my new publishers are men of integrity and master craftsmen in their own right. The fact is.....they had not a whole lot to do after I handed them the materials. They did some spitshining and polishing; grinding of the rough edges, but yeah, the ULTIMATE SCANNER is.....mine. So there may be a bit of ego in it, but I claim the right to use it as my primal scream of victory and triumph over the the strata of utter ignorance from where I stood not four years ago. Yes.....if you could see me now, I stand with fist clenched and right arm reaching into the sky and my scream in the thrill of victory would make Tarzan of the Apes shrivel and whine for his Mama.

You cannot possibly know how far I have come in four years, but if you have seen Vols 1 & 2 of my books, and then Cheek3.....you will see a great distance between them. I traveled that distance in my own moccasins and it was painful every step of the way.

Oh.....not that Cheek3 is one for the history books. It is not. It is only my "masters thesis".....a compendium of information and bits of this and that to lay the framework for what may come next. I challenged myself to set a standard.....and then to beat the living shit out of it on the next effort. That clearly means this one is not perfect. At the same time, it challenges other publishers and writers to beat it.....if they can.....and to be perfectly frank: I hope someone does!!! Nothing inspires me more than to have someone overtake me and dust my britches. Ooooooooohhhhh!!

Therefore, Cheek3 is definitely subject to criticism, and I welcome it if given with any semblance of sincerity, honesty, integrity, and meaning. I -=want=- other writers and publishers to spit out something better.....and while they are sitting on their duffs right now, desperately planning the effort, I want to be planning my next, as well. To an extent, I know what I have to do to kick my own ass, but healthy criticism is always welcome. Let me make that perfectly

clear on no uncertain terms.

On the other side of the coin, Andy Moss brought into this virgin arena an axe to grind from another realm where he was forbidden from any further grinding. His critique of me and Cheek3 were unwarranted and unwholesome. I will stand on my own two feet and fight that kind of crap to the bitter end..... Moss has nothing to offer this forum or this hobby of radio, but he apparently seethes with venom and envy over every move I make. I suppose I have a few enemies, and he is one. Nevertheless.....this forum and this world are plenty big enough for the both of us under certain well defined rules that we all are generally expected to play by. But he broke those rules, and I will not shrink and shrivel under his attack.

You know why not? STOP. LOOK. LISTEN. Just how many writers and other accomplished people make themselves available for public scrutiny and interaction? Quite a few have given it a try, but what happens? Sooner or later, the Moss's of the world start turning the screws; the heat comes down; and the experts go on to find other things to do. I don't need to mention names.....you guys can't count the ones who have come and gone; but I aim to see to it that you CAN count the one(s) who have come and stayed. Here I am, boys and girls, first and foremost.....one of you. I am not going to be isolated and sent packing. But since THAT is Moss's sole objective, and perhaps the objective of a very few others, I aim to take everything they dish out....and then slap a wad of snot and boogers outa their noses and feed it to 'em for their time and trouble. I've never been given to running in real life so let it be etched into stone that I am not going to run in cybermedia.

And yet, I am nobody. Just a regular ol' dude who walks in his own moccasins; signs his own checks that don't hardly ever bounce; puts on his britches one leg at a time; sinks in water more than an inch deep; and eats off his own dinner plate. I write books and I know a little something more than the average bear about this hobby and business of radio. But I don't know shit from Shinola about racing engines; architecture; banking; women; and politics.

So there it is. It may as well just be gotten out and laid on the table. I did not appreciate Moss's personal attack on me; nor Greg Renner's initial evaluation of (me) and Cheek3. I am not here to be evaluated, same as YOU are not here for that reason. What we DO is open season within reasonable limits and lattitudes. I can take a lot of heat.....and my work can take even more. But there's a right kind and a wrong kind. I will fight the wrong kind and placidly accept the right kind.

Oh.....and I rather enjoy a good peeing contest now and again. So those who like to pee will find me a challenging adversary. But I also enjoy good old fashioned shooting the shit about radio and technology and plain relaxing fun stuff.

That's all. G'nite.

Bill Cheek
Nobody....

Bill, are you ever capable of answering a topic without injecting venom and insult into nearly every sentence? Despite what you think, not everyone is out to get you.

I read your lastest issue of World Scanner Report, and you have three columns in there in which you explain that you cannot provide your paying customers with the same level of support that other merchants provide theirs. The main reason, you say, is that ever increasing numbers of people are trying to rip you off. I don't know about everyone else, but I paid my $25 and I expect to get my money's worth. Whensomeone doesn't give me what he has committed to delivering, I expect to get some or even all of my money back. I (and I'm sure that most of your readers too) am not out to "take you to the cleaners," as you write in WSR, Mr. Cheek). We're decent, upstanding folks--maybe just as good as you.

Let's look at it from my perspective. The current issue has three columns devoted to your less than charitable views of your customers; it has three columns from a lady who says her husband's scanning hobby is A-OK; and it has 2.5 columns on computer talk in which you say "computers are hear to stay," and "don't buy OS/2 because it is not well supported around the world," other dubious bits of advice. Knock off a couple of more columns for the address label, a plea to renew the subscription and some other house-keeping kinds of stuff. Add it up, and you get 20 columns of good, solid info out of a possible 30. If it were one issue, I suppose that I wouldn't mind, but it's been that way for the last few issues. WSR is becoming less relevant and more a platform for Mr. Cheek's personal views (I'm sorry, that's not what I paid for). Yet, you've already judged that I'm a sam artist and have told me as much in print. What hope do I have of getting a refund (I don't want one, by the way, I just don't plan to renew the subscription).

The point of all of this rambling is that sometimes, Mr. Cheek, you're wrong and the other guy is right. I'm not saying that this is the case here--there's a lot to argue with in what I've said. But if you're not willing ever to concede that you make mistakes or that the other guy's point of view is equally valid, don't expect me to take you seriously.

What

are your really getting at? Do you object to people expressing their opinions? Grove and his business is well known. Of course, people are going to have opinions about him. They are not necessarily valid, but they have the right to express the. I thought that is what normal users do. If you find that frustrating, you should not read anything that has Grove's name it, as the other gentlemen suggest.

To Bill and all

Bill you are not in my shoes. I speak for myself and my radio club
even if I put in the disclaimer that the opinions are my own. I still
sign with the Minnesota DX Club after my name.
It does not matter what my review says good or bad. Part of my point
is that reviews mean nothing, I would not own a Icom R1 had I paid
attention to the reviews. What matters is that this group remain a
scanner discussion group and the messages that started you and Andy off
and fortuantely ceased do not belong here. We are now refocused and I
see you are answering questions regarding beam antennas and 2004 CPU's
a very positive addition to the group.
Regarding your at times uncaring attitude, I run a program for
chronically mentally ill high school students. I have literally heard
and seen it all, your at time uncaring statements pale in comparison.
Your at times bully like attitude in the e mail posts was almost
refreshing compared to being hallucinated by some one into being a
monster and having them work very hard at killing me.

Enjoy the hobby, life can be short and complex

You'll have to be close to the airport, actually almost on, to listen
to ground comms, tower and clearance delivery and pre-taxi traffic.

As far as approach and departure goes:
Washington Natl approach from the east is on 118.3, west 124.7
Departure is on 121.05 to the west from 10k feet to 23k feet
118.9 to the west at 9,500' and below, 125.65 to the east 9500 and below
and 126.55 east 10k feet to 19k feet.
Tower is on 119.1 and 120.75 for helicopters
Ground on 121.7
Clearance/pre-taxi on 128.25
ATIS on 132.65

>Any reply will be appreciated . Thanks.

There are a number of sound-activated tape recorders on the market manufactured by many vendors. The feature is usually tagged as "voice-operated recording", or something to that light. I have a Sony version--they made several the last time I took note. A store with a good selection of cassette recorders--particularly compact Walkman-size styles--will probably have one or more sound-activated models.

Incidentally, the Sony that I have also is suppose to time-stamp the recordings as the tape recorder is tripped. The time and date of the recording is displayed on the front panel LCD when the tape is played back. Unfortunately it only works about half the time...

This question has probably been asked and answered many times before, but I'm new to the net and need help.

I operate both the RS PRO 2026 and Bearcat 590XLT mobile. They are wired to the car radio's power input line so that they turn on and off with the ignition key.

The problem is that periodically they lose their memory and need to be manually reprogrammed. I've talked with Bearcat and they are aware of the problem but have no fix.

Anybody else having the same problem? Does anybody have a solution?

Thanks, in advance, for your response.

595. Opto 456 for pro 2006

Can anyone give me a basic run down on the opto interface board for the pro2006? I have read
a little about them but would like more info. Is it an I/O board that
goes inside the PC or an external unit that connects to the com port?
What is it used for, and does it come with software or do I need to find
an outside vendor. The only program I have heard of is Scancat Gold, but I
dont know who makes it. Any help would be appreciated. Thanks!!

: talking over a rambling pilot, etc. and you can usually make out all of
: the conversations. If it were being established today, it would likely be
: digital, spread spectrum, with certain codes reserved for ATC to override,
: and the tail number coded into the radio.

Yes. And a signal that is one thousandth the strength of another can be
heard underneath the carrier of the stronger. So even if the tower can't
hear the second plane the op's know that there is someone there. And
besides, there isn't that much electrical interference on VHF AM.

Cheers!

> connectors, so connectivity is a snap.

Yep. I have that very attenuator, and it helps with the intermod that I
get on my PRO-2028. (I am using an outside antenna, obviously). The
problem with the 2037 was that in order to eliminate the desense, I had to
turn up the attenuator so high that the dignals I wanted to listen to were
completely attenuated. I was thinking about trying to find a PRO-2006,
because I've heard good things about them, but they seem to be rather
expensive on the used market, since they are cell-restorable (something
which isn't important to me).

> I know isn't in the 800 band. Glendale is, though, and I've not had ANY

> too. However, a good external antenna will hammer it with pager signals,
> worse so than the 2022 (why? I dunno...).
> Anyway, you might try an attenuator.

Hmm...That 2022 sounds pretty good. I know when I programmed the Tempe
trunked system into the PRO-2027, I got cell images on at least 3 of the
10 channels. When you say "hammer" it with pagers, do you mean that I'll
get simple overload (i.e. the scanner will sometimes stop on a pager
signal), or that I'll get band-wide desense? I get a lot of the former
type of interference on the PRO-2028, and I can live with it. But if
the whole VHF band is desensed, that's not acceptable.

Thanks for the advice.

I looked in a few of my San Diego freq books and didn't find any that specifically met your needs; however, almost all of the RR freqs for Southern Cal. are listed to be between 160.245 and 161.565. The 452.900 freq you mentioned is noted several times as a carmen freq. All others listed are within the range I listed. There still maybe other, but this is all I found.

They also have an easy to remember toll free number.

1-800-LIFTOFF

I think AF/Ds run about $3.50. They also carry some unofficial guides that have lot's of information. I use a "FLIGHT GUIDE" for the western U.S. Airport information, including diagrams (that are not in the AF/D), for all published airports in WA, ID, MT, WY, CO, UT, NM, AZ, NV, CA, and OR. There are two other volumes available for the central and eastern U.S. At about $30.00, the "FLIGHT GUIDE" is more valuable to a pilot but it contains a lot of airport frequency information (plus other stuff) for quite a large geographic area. The price includes one free update sent to you about six months after purchase. These are also available at some local pilot shops. I just bought a new one at the Flying Gift Shop at the Livermore airport terminal building - they carry the AF/D and charts as well.

FYI Sporty's is not considered a discount shop. Their prices are pretty much the same as local shops. But they are convienient if you don't need something the same day.

> Tim Henrion
> thenrion@netcom.com

The Grove Scanner Beam is optimized for a wider frequency range
than a regular TV antenna although I suppose a regular TV antenna
may do the job. The GSB includes 30-50, 108-174, 225-400, 406-512
& 806-960 MHz. Look at a freq. allocation to find TV freqency
ranges and that's what your TV antenna covers + 88-108 if the
antenna says it's for FM radio also. The GSB is $59.95 in my last
catalog.
Happy scanning

Source record: 252661

Hi,

Anybody in the central Florida area know about SkyWarn? It's apparently a net of hams tracking thunderstorms in our area, reporting from both base and mobile transmitters. The repeater frequency is 418.5 - odd, since that is a U.S. government frequency. I figured it was an image from the ham bands, so I checked what would be the "real" frequencies at plus-minus 2X my IF - 10.7 x 2 = 21.4. Nothing. And to deepen the mystery, my other scanner (PRO-2028), which has about the same specs and performance as the other (PRO-2022), picked up nothing but shot noise while the spotters were booming on the same freq on the 2028.

Any ideas? (Incidentally, central Florida scanners, this is a *very* entertaining frequency when active.)

Date: 1995-07-10 00:00:00 UTC
From: mjr@crl.com
Message-ID: <3trv91$k33@crl.crl.com>
Source record: 252662

I have a Model 25 Optoelectronics SCOUT for sale. This is the original model scout with 25 memories. This one is in perfect condition, as is, with no antenna and no filters. Original price was $360 or so, I got it for $300, and will let it go (after a small amount of use) for $175.

Please contact me by email (mjr@crl.com) if you are interested.

I have been reading this Newsgroup for a few weks now and have found that most of these questions could be answered with very little research. But....I believe that one of the best resources to find frequencies is to get your very own copy of the FCC rules (part 90). This book, although very dry reading answers most of the questions regarding the "other side" of a repeater pair, allowable power output, what might be the source of something you hjeard on certain frequency (i.e. if its able to be licensed to a "business radio" user or a "special industrial" user...and if you had the book you would know who is eligible for a "special industrial" license...) The FCC writes the rules, try reading them sometime and you would be amazed what restrictions are written into the laws for the users (and salespeople) of commercial business radio systems. Most of the Public Safety radio which many on this newsgroup discuss are governed by this rule section. Call any Federal bookstore and get your copy soon! Maybe you will learn what makes these systems work the way they do and within what guidelines.

No "flaming intended...only information"

IE>>DL> heard some, "truckers," having an intelligent conversation....

IE>I'd say that rates two or three notches above "strange." Try unbelieveable!

Yep, believe it or not, It's true. I've heard quite a few QSOs between
truckers, especially on the Linked systems. It seems that they have
gotten tired of the regular form of communication on good ole Channel
19.

> Southern Cal. are listed to be between 160.245 and 161.565.

Except for on the Northeast Corridor (Wash., DC to NYC), Amtrak doesn't own the tracks it runs on. That's why if you want to listen to Amtrak, tune to the frequencies used by the "host" railroad (the one that owns the tracks). For the San Diegans, the host railroad is Southern Pacific from Santa Barbara to Los Angeles Union Station. From LA south to San Diego, the host railroad is the Santa Fe. (As far as I know... the new San Diego "Coaster" commuter service between Oceanside and San Diego may have involved an ownership change for that part of the line, I don't know off the top of my head.)

For RR frequency questions, be sure to post (or cross-post) to one of the railroad newsgroups (eg: misc.transport.rail.americas or rec.railroad).

>Thanks, in advance, for your response.

Are the scanners "on" when you start the vehicle? The radios should be turned off before starting and/or killing the engine. Only turn them on once the engine has started and is stably idling.

Also, install a "noise suppression" filter (like those used for car stereos, Radio Shack sells at least one of these kits), which usually consists of a coil and a capacitor. This will prevent high frequency "snippets" from your alternator and/or wiper/heater motors from walking into your scanner via the power leads. A large capacitor across the power feed will also help span lower frequency disturbances.

Make sure your power connections are SOLID... no cigarrette lighter plugs, no ground connections to painted surfaces, etc. Same goes for your antenna connections.

The automobile is almost as bad an electrical environment as a boat is! You have to almost stand on your head to overcome some problems. If you pay attention to the basics of CLEAN POWER and SOLID GROUNDS, then 90% of your potential problems in the automotive environment will be academic.

Steve

625. 800MHz Trunking and Scann

Newsgroup: rec.radio.scanner
Date: 1995-07-10 00:00:00 UTC
From: gary.saffer@channel1.com
Message-ID: <40.24117.2433@channel1.com>
Source record: 252672

FDL>I hope someone can confirm or deny (with certainty) someting that I was
FDL>told by a Uniden 2-Way and Scanner Dealer. I was told by a friend of
FDL>mine that Uniden and Ericsson announced, at the radio
FDL>dealers/manufacturers conference out west, their agreement on Ericsson's
FDL>behalf to allow Uniden to manufacture EDACS capable 2-way radios. My
FDL>friend suggested with this agreement that by next January ('96) Uniden
FDL>will be manufacturing a scanner capable of monitoring EDACS systems.
FDL>This sounds great but the more I think about it how will we listeners be
FDL>able to figure out the codes (not frequencies) to program into these
FDL>scanners so that we can listen to each talk group? We know the EDACS
FDL>radio dealers won't tell us their secrets. Let's discuss. Any input
FDL>would be great!

My guess is that the agreement will specifically prohibit Uniden from
using the technology in scanners. I am pretty sure that the scanner and
two way divisions of Uniden are totally separate entities. So, there is
very little likelihood that the two will share technology.

FDL>P.S.- I have a sincere interest in this topic right now since I just had
FDL>to purchase a RS PRO-51 to monitor my city's Fire and Police who just
FDL>switched to an 800 MHz Ericsson/GE EDACS system and right now as my
FDL>patience wear thin I DO NOT BELIEVE that GE brought something good to life
FDL>in this case.

There is an interesting ad in the current issue of POLICE magazine by
GE/Ericsson. The ad attacked APCO Standard 25 as promoting the
proprietary technology of one company (Motorola) and excluding other
systems. It states in part that the Motorola system does not comply with
the original specs in APCO 25, and that EDACS in fact exceeds the
standard. Pretty interesting.

The REAL truth is as noted in my most recent article. Yes I did read
the entire book first as I always do prior to a review. After
clairifications of some issues in email with Bill and having him point
out some special aspects of the book I had missed I changed my mind.
Hey after all this is just my opinon get a copy of the book and judge
for yourself. I always take reviews with a grain of salt they are one
person's opinion afterall. The CE 232 is one of the important aspects
of The Ultimate Scanner covering nearly 50 pages of the book's a little
over 200 pages. With nearly 1/4 of the book being devoted to the CE
232 one of the major thrusts of the book becomes computer interfacing
your scanner.

I think I've figured out the difference between GMRS and itinerant frequencies.

But what are the power limits for GMRS. Can you buy a 4-watt UHF GP300, say, and have it programmed for the GMRS channels. Or do you have to buy a P10 or the new Maxon, which both have 1-watt output?

Gary Allen

I used to see the Create LPAs prominenently displayed in EEB ads
in some of the magazines. I don't understand what you mean by
"...those 'in the know'"

>Perhaps CREATE feels as you intimated about EVERYONE and not just
>yours truly. Perhaps they have no feelings at all, and simply are
>there to make sales to whoever has cash waving in the breeze.

Perhaps their sales are strong enough, without the need to
advertise a lot, & to sell their product at a discount to someone wanting
to write a review about it.

Also, I always appreciate finding out which of the radio product
reviewers just buy the product like everyone else, and which apparently
write to the manufacturer & request/expect to obtain one at a discount.

>>Given the size of a Log-periodic as compared to a conventional yagi for
>>the same frequency, the gain of the log-periodic is considerably LOWER.
>>Hardly likely to knock ones socks off.

You're right! It is a much better idea to have 10 or 20 yagis &
feeds, instead of *one* LPA with one feedline...

>
>Log-periodics for 25 MHz - 1300 MHz are......large. The Create Log
>Periodics are.....very large. VHF-UHF log periodics are MUCH larger

Sure, LPAs cut for 25-1300MHz are large. As for the Create LPA
being ".....very large," again, you're using a relative term, but since
the broadband Create LPA is rated for 50-1300MHz, it might be "very
large" to you, but it won't be as "large" as a 25-1300MHz LPA.

Despite its size (which isn't as "very large" as you indicate,
IMHO), the Create 50MHz-1.3GHz is relatively light (I'd guess around
25lbs), constructed well, and certainly doesn't look march larger than
a TV antenna once up on the roof (i.e. it isn't going to stand-out too
much, & look like some big old HF beam...).

>so. Your statement is utterly meaningless and without value.

Heh heh heh...

>boy to do a man's job.

Hey, seems like you guys are 7-year old twin brothers to me...
But from the standpoint of someone who some day might have been
interested in purchasing one of your products, your post was an
educational experience for me. As someone who has owned the 50-1300MHz
Create LPA for around 5 years, as well as a variety of other directional
& omnidirectional tx/rx & rx-only antennas, I disagree with most of your
opinions concerning LPAs in general & the Create LPAs specifically.

Anyway, for anyone out there interested in an LPA, don't be
discouraged by the few LPA-related comments in between the squabbling!
Bill talks a lot about LPAs & Create Industries, but the bottom-line is
that if he needed to ask them to send him one so he could do a review, he
apparently doesn't have much (any) first-hand experience with the Create
LPA models!

From: robert@eden.com
Message-ID: <3tqbo3$f6o@boris.eden.com>
Source record: 252726

Former Pres George Bush came to see his son, George Jr. Get Inagurated as Governor for Texas.

Secret Service people were carrying large VHF handhelds that were on Baker which is our local repeater here on 165.7875. This traffic was in the clear and was announcements of arrivals and departures. I did notice that SS was making no secret about having the handhelds..where as before..they never displayed any radios at all.

But Agents were using wrist microphones.. I have all the VHF frequencies in and heard nothing. Frequencies that were formally active such as Tango 164.65, Sierra 166.5125 and Oscar 164.8875 had nothing on them.

Thinking it had to be UHF I concentrated on that band running searches for several hours. Nothing more than Baker was found.

AFter making a post on here.. I got many private Email messages telling me that the agents are now using UHF frequency hopping radios in the 407-409 Mhz range.. CAN ANYONE CONFIRM THIS??????

And if this is true,, I guess I should have gotten out my Interceptor.. shouldn't that have worked..

there is one problem with the 8x, it isn't very sensitive. I have one and
if anyone wants to buy it I'll be happy to sell it. I would suggest an
optoelectronics model dc440, it decodes dtmf and ctcss, which you may want
later in your scanning life. There phone number is 1-800-327-5912.
There is one problem with this model too: the price. it's $259.00, I guess
you get what you pay for.
P.S--I'll sell my 8x for about $30.00 if anyone is interested.

650. Shuttle Freqs In Phoenix

Newsgroup: rec.radio.scanner
Date: 1995-07-11 00:00:00 UTC
From: lager@primenet.com
Message-ID: <3tucql$ejm@dump.primenet.com>
Source record: 252481
Cross-posted to: rec.radio.amateur.equipment,az.general,rec.radio.scanner

I found a source that says that the NASA select shuttle broadcasts are repeated on 448.975MHz and 449.000MHz here in Phoenix. I heard some non-shuttle traffic on these freqs but not a single shuttle related transmission during the last flight. With another flight happening this week (hopefully) I would like to know if anyone in the Phoenix area was successful in hearing rebroadcasts on these freqs or if they know of other freqs to monitor? Thanks.

********** Help Wanted **********

Position: Hacker, hobbiest, engineer or anyone with similar talent.

Project : Decode,decript,and diagram the Serial Interface for the
Standard Radios HTs. All protocols,handshaking and supporting signals
must be defined. All required commands and syntax for tuning,
downloading and uploading memory are required. Definition of usable baud
rates, bit confiration and data relating to squelch operation are also
needed. Define internal mapping of memory and relation to channel
memory. Notation of any quirks in computer interface operation, should
also be noted.

Payment: The first person to successfully complete the project will
recieve an Optoelectronics Scout 40 Ver 3.1 with a DB32 antenna.
Success will be determined by the ability to use the gathered data and
successfully transmitting data, cloning (if possible) and computer
control of the device.

Just passing some info on for the benefit of others....

Percon has expanded their offerings of Opto products.

They are now selling the Opto ScanBlaster bundles.

Each ScanBlaster series includes in the accessory set:
CX12AR Computer Interface
N100 FM Notch Filter
BLP-70 Low Pass Filter
BHP-800 High Pass Filter
DB32 UHF/VHF Mini Antenna
RD27 27MHz Antenna
RD440 440MHz Antenna
RD800 800MHz Antenna
Spectrum CD-ROM FCC Database
Utility Disk SCOUT Download Program
AC100 Rapid Charge Adaptor
Cable/Adaptor SCOUT Reaction Tune (Pat. Pend.)
CC30 Carry Case for SCOUT
+++ 3 YEAR EXTENDED WARRANTY +++

Each ScanBlaster listed below includes the Accessory set listed above
with the noted additional equipment.

SB	Additional Equipment	SRP	Percon
I	Scout, OptoScan 456	$999	$949
II	Scout	$849	$799
III	OptoScan 456	$699	$649

For more info, contact Percon @ 716-386-6015.
In addition, Opto can be reached @ 305-771-2050.

>FDL>scanners so that we can listen to each talk group? We know the EDACS
>
I have given some thought to this question. The conclusion I reached is that trunking-capable scanners will almost have to contain a "learn mode." When you initially tune in to a previously unknown system, the scanner will monitor the system for a period of time to determine the talk groups in use. The list can then be presented to the user who can determine what agencies use what talk groups for what purposes. The user can then lock out talk groups that are not of interest.

In the trunking world scanners will not scan frequencies for traffic as much as they will scan talk groups. Our databases and frequency lists will need to contain talk group information as well as, and maybe more than, frequency information.

Another question that comes up with trunking systems is "will they require a dedicated scanner?" The answer is no. Because the trunking data channel continuously rebroadcasts information about what active talk groups are on what frequency, the scanner can scan non-trunking systems too. On each pass the scanner can simply "listen" to the data channel for activity on any of the talk groups of interest. If activity exists the scanner moves to that frequency. If no activity exists the scanner simply continues to scan the other non-trunking frequencies.

>
>
>--
>Emmanuelle Faraut
>faraute@ERE.UMontreal.CA

Yes it is VERY good, at least I think so and I know many other people do too. 800MHz band expansion is remove top two boards, remove metal shield from the third, unsolder a diode labeled D4. Resolder to the D3 position to restore the low band up to 88MHz. My scanner has the low band restored but I don't know that is was worth it. The replacement speaker was though, also the audio mod helped too but you'll need a service manual for that one.
If your scanner has an A in the FCC-ID then I believe it can't be modified. I don't know your scanner so I can't be responsible for any problems if you tear into your scanner. Good luck!

: ignition key.

: The problem is that periodically they lose their memory and need to be
: manually reprogrammed. I've talked with Bearcat and they are aware of the
: problem but have no fix.

: Anybody else having the same problem? Does anybody have a solution?

I had the same problem with my RS Pro 34! I had it hooked to the ignition switch and occassionally I'd find 200 channels set to 0000.00. I wired the voltage converter to the battery and turn the scanner on and off manually now. It doesn't put enough of a drain on it to worry about running the battery down if I forget.

I asked Bill Cheek about it at the time, and he didn't have an explanation either...

I also run the audio through the stereo via a cassette adapter (from Radio Shack).

>Anybody else with this model? I love it when it works.

I think $45 is a good price if they repair your BC-250
properly and promptly. Some of the components in the BC-250,
particularly the Exar NC57902 divider (IC6), are no longer available.
I hope the problem is due to a more common ailment, e.g.
a pass transistor failure.

The Electra/Bearcat BC-250 was a very innovative model for
its day and was the first consumer scanner to have an intelligent
auto-store (search & store) feature and tape recorder control
on a per-channel basis (AUX). The COUNT feature was another
good idea.

Uniden now owns the Bearcat line and we haven't seen many
innovations in the almost 20 years since the BC-250,
except for faster scanning and automated manufacturing.

The BC-250 frequency coverage is limited and the synthesizer
is noisier than current models, though.

Check "http://sd-www.jsc.nasa.gov/shuttle/comm/freq.txt" for a U.S.
wide repeater index listed by state. Hope this helps!

Ken, possibly a harmonic. 52-53MHz according to the ARRL band plan
is FM repeater and simplex for the 6 meter band (50-54 MHz).
I don't have that much experience with harmonics but operations
in the area of 52-53MHz would have an 8th harmonic in the area
of 416-424MHz. This is just an idea and I admit it is unlikely
but I would like to know if you find it.
Happy scanning!

Many public service agencies still use frequencies in this range.
why to you hear them from a distance? It's not unlike turning on your
AM radio in the late eveningand hearing stations loud and clear
from hundreds or even thousands of miles away. 33MHz is close
to the 10 meter ham band and for this band, the direction of the skip
is generally toward the sun.
Happy scanning!

The center freq. is 42MHz. 468/42=11.14ft This is for a half-wave
dipole. Cut that in half, attach one half to the center conductor
of the coax, and the other half to the ground (sheilding).
Should work great.

262.125 was *very* busy up till last friday (7/7/5). Since then
it has been quiet. I saw that the shuttle returned friday so
perhaps the 262. traffic was icw with its return.
I have noticed lately that the military UHF band has seemed much
more active. It seemed quite dead up until recently and especially
the "satcom" freqs.

OOPs, I ended my last post too soon. I was trying to add that it
could be splatter from a nearby ham freq. caused by overmodulation
of a transmitter but if you are hearing it from more than one
transmitter It probabally isn't splatter or a harmonic. Are you
absolutley sure you figured your harmonics right? Just to be safe,
check the entire 420-450 MHz band.
Happy scanning!

Joe

Awhile back I received in the Minnesota DX Club PO Box a priority mailed packed full of info on this (what they said) was going to be a TV program. They were making a contest and a monetary reward system out of sending in tapes of locally scanned events. The ones who sent in the most good tapes which completely followed a story or event could win cash or other prizes, I don't remember. But the way it was promoed in their mailing was as a TV show not a 1-900 number.

The question the folks had in the radio club was the legality of reproducing items taped on a scanner. Anyone know what the legality of all this is? No one in the club was interested so I tossed the information.

It's really too close for skip, but what you can be experienceing is
either ground-wave propagation or a duct affect within the Troposphere.
33 MHz, as opposed to VHF-high and UHF, isn't as nearly line of sight,
and the radiowaves bend along the Earth's surface. VHF low is a really
weird spectrum, and it takes on properties of both HF and VHF-high at times.

>Does anyone have the directions on how to trim a regular TV antenna to be
>a good scanner antenna?

It shouldn't have to be trimmed. the police and fire bands run right
through the middle of the TV bands. You will need to transform the
300 ohm antenna impedance to the 50 ohm used by your scanner. You cant
just use the transformers made for TV since they convert to 75 ohms
used by TV coax. Try the library. They will probably have an amateur
radio handbook which shoul;d describe how to build a BALUN which is
what you would need.

DR> Hmm...That 2022 sounds pretty good. I know when I programmed the Tempe
DR> trunked system into the PRO-2027, I got cell images on at least 3 of the
DR> 10 channels. When you say "hammer" it with pagers, do you mean that
DR> I'll get simple overload (i.e. the scanner will sometimes stop on a
DR> pager signal), or that I'll get band-wide desense? I get a lot of the
DR> former type of interference on the PRO-2028, and I can live with it.
DR> But if the whole VHF band is desensed, that's not acceptable.

I've noticed very little desense on my scanners. "Hammer" means intermod,
that horrible sound that results from two frequencies mixing, giving you the
worst of both. Desence (or overload) won't mean that the scanner stops on
the pager signal... it won't stop on ANYTHING during desence. Intermod will
often let you hear just the pager, as the pager signal will be, by far, the
more powerful signal; the second signal will just get lost under the pager
signal.
See ya!

JH> phone is not scanable. Is this true? Do any of you guys know if you
JH> can pick-up conversations on a 900mhz cordless? Thanks for all your
JH> help!

Depends. Some 900 MHz phones are scannable, some aren't. There are some that are harder to scan than others.
Spread spectrum is pretty well unscannable. So is digital encryption. Both in the same phone is overkill.
Voice inversion is secure from most hobby scanners, as very few will bother to get the hardware to handle this (OK, please don't anybody tell me I'm wrong, simply because *YOU* have one. The vast majority of hobbyist scanners DON'T!). It is *NOT*, however, secure from a dedicated scanner who has the hardware, and certainly isn't secure from any government agency.

Realize this, however: anyone who really wants to hear your phone conversations, for good or evil, will not bother with your cordless phones, as they are probably only a part of your phone conversations. They will go fo a hardwire phone tap, and get ALL your phone conversations, unless you use a cell phone. The hardwire tap has the advantage of not being encrypted, also.
A non-secure wireless phone should be OK, as long as you are aware that it can be listened to. Simply bore the listeners to death!

JA> from this.

I'm not a lawyer, amd really don't *KNOW*, but I'll present a theory:
The Public Safety entities are broadcasting with OUR money, and broadcasting stuff that happens in PUBLIC.
As opposed to private, commercial entities which are using the airwaves for their own. private purposes.
Given this, there might be a legal point against trying to say that it's illegal to listen to, or pass on, what's said over the airwaves used by public entities like police/fire.
Like I said, this is a THEORY. I don't know of any cases where anyone's actually been prosecuted for LISTENING to public safety broadcasts. Even that person who's had radios confiscated, and been subject to legal proceedings is having all this done not for listening, but for possibly breaking non-proprietary coding/systems, and possible theft of proprietary software.

JA> And, why would someone PAY $1.99/min to listen to scanner
JA> stuff that most people hear on their own scanners?
JA> Just my $0.02 worth.

Maybe because most people don't have a scanner?

VS>Original Date: 10 Jul 1995 23:11:36 GMT

VS>Is it a good antenna to use for receiving 30 - 54 mhz... A long wire of
VS>copper between two trees hook up to my radio will increase the performance
VS>or not? ...and do I connect the ground of the coax to something? Please

Oui, it will help.

Connect the coax outer conductor to the chassis or metal cabinet of the
radio and connect a 12ga or so copper ground wire from the chassis or
cabinet to a cold water pipe or a ground rod driven into the earth.

The grounding on the outer conductor of the coax to the earth makes the
radio resist nearby interference, like hum from electrical appliances.

Hang the long wire in the trees from two plastic or poly rope insulators
and solder the center conductor of the coax to the long wire near one
end. And while you're at it, just solder everything. Go crazy. You
can never have enough solder connections! :*)

Make sure no little wires from the outer conductor reach over and touch
the center conductor or you'll get no reception at all.

Where's Universite Laval? I detect a French accent.

Amtrak uses the frequencies of the host railroad. Only on the
Northeast Corridor between Wash. DC and Boston does Amtrak use
their own frequencies. So to monitor Amtrak Anywhere else in
the US, find out what big freight lines run through your area.

On the west coast, I would check out Santa Fe, Southern Pacific and
Union Pacific and Burlington Northern just for starters.

I'm pleased to announce that a list of Santa Clara County Public Safety Frequencies is available on the World Wide Web. Point your browser software to the Santa Clara County Sheriff's Office Home Page at URL:

http://www.amdahl.com/ext/scc-so

An extensive list of police, fire, EMS and public works frequencies are available. The list has some State agencies available, but excludes most State and Federal investigative agencies.

The Home Page also offers a view of the different insignia used by the Department over the years and has historical facts on several topics.

Stay safe and happy scanning!

>Bob Szabo

Im using a Panasonic RQ-L340 with my YUPI MVT-7100. I also need to use
the Radio shack attenuator cable to hook it op to my headphone out
since there isnt a line output. VOX works great, sound is good.

I guess the point here is that if you are monitoring a continuous
signal, your limit is the length of the tape. If you're looking to
'auto record' a non continuous transmitter (such as the local
dispatcher) just get a personal recorder with VOX.

Marc

714. Re: GMRS Info

715. AR8000 sound breaks up

Newsgroup: rec.radio.scanner
Date: 1995-07-11 00:00:00 UTC
From: tabithac@aol.com
Message-ID: <3tv9jo$src@newsbf02.news.aol.com>
Source record: 252596

I am having a problem with my AR8000, and I don't know if it is normal behavior or not. When the scanner picks up a strong audio signal the sound breaks up. It isn't really related to the signal strength on the meter, I could receive a strong audio signal with just a 5 or 6 on the meter and it breaks up, but then receive a not so strong audio signal with an 8 on the meter an it will be fine.
My AR1000xlt never had that problem and when I listen to them side by side the AR1000xlt sounds so much better.
I have played with the squelch level and set the attenuator for these strong signal, but same result.
Any ideas?

TabithaC@aol.com

716. RS Pro-2037=Opinions?

From: billv21572@aol.com
Message-ID: <3tvbgq$at@newsbf02.news.aol.com>
Source record: 252597

Hello All,
I'm new to this newsgroup, a longtime shortwave listener breaking into scanning now. In the latest Radio Shack flyer I see they offer the Pro-2037 - seems like a good deal at $100.00 off, only $199.99. 200 memories, pretty decent coverage I believe; doesn't get cellular phones I bet, but that wouldn't be a big priority with me. Anybody out there with firsthand knowledge about this thing? Is this a good place to start? Is there a better radio to start out with instead? How's that price? Any feedback would be appreciated both posted to this newsgroup and as email to me.
Thanks alot.

That is exactly what HI CUT is, a low pass filter. Actually, when the
HI CUT signal is asserted it causes two capacitive elements of an existing
low pass filter to increase and lower the critical frequency. It is
designed to help eliminate high frequency (audio) noise that can be very
irritating on some receptions. In most cases you wouldn't use it but since
the BC9000XLT makes it a programmable feature of each channel it is a
rather nice feature.

Whoaaaaa there. I posted nothing to him or about him until he had cut loose twice. It isn't "me and Andi". It's Andi. Period. I hadn't posted here in weeks when he ripped loose with a couple of big ones thinking I wasn't around. That is clear fact....inarguable.

>We are now refocused and I see you are answering questions
>regarding beam antennas and 2004 CPU's a very positive addition to
>the group.

THAT would be a natural state of affairs under "live and let live" circumstances. Not a difficult path to follow. I've only been doing it for years, so that's why I say 'natural'. The outside attacks come unprovoked. Fer instance.....I said or did nothing to provoke you into saying there was no room for the CE-232 since the Opto 456 was out. You and I had -=never=- conversed before then. Look, a dead horse is a dead horse, but the inference that I do anything but answer questions and render assistance is a trifle slanted considering the simple facts at hand. Your statement was relatively innocuous compared to Moss's diatribes. And I gave both about 48 hours before answering both. That was largely because Moss' and your missives were relatively unchallenged.....and both deserved it. So I did.

I'd like not to be tasked for a clear-cut and dried situation.

>Enjoy the hobby, life can be short and complex

Frankly, I don't do much of anything that I don't enjoy. If it's not fun, it's probably not worth it.

The 900mhz phones are monitorable unless they use the digital spread spectum technology. I was looking into purchasing a Uniden exp901 and called Uniden and she said it was not a secure phone.

>

The LINE out jack is an attenuated level taken directly off the SPEAKER
out jack that does not turn off the internal speaker. It is kind of
strange that Uniden opted to configure the radio this way let alone
put the jack on the front. You could take the audio signal from the
volume pot at pin 5 of J4 on the main PCB but it would then bypass an
audio filter and the HI Cut Filter, might be a little noisy. Also,
depending on the distance to your amplified speaker you may need to
include a pre-amp. You might be best off to add a switch in series
with the speaker or perhaps a DPST connected to the speaker and the
LINE out jack to toggle the signal between them.

The AUX jack on the back is the dry contacts of a relay that close when
a channel that has the record option programmed becomes active. This
is designed to start and stop a tape recorder when a signal is present.
Again, why they opted for an RCA jack here is a mystery to me.

> But when I use 2 simple straight wires, the recording is perfect.

The only thing that I can think of is that you are using a
microphone input instead of a line input. Line levels are much higher
then microphone levels and you are most likely overdriving the microphone
input circuitry. You might get good results using the speaker jack
because you can adjust the levels down (although the impedance mismatch
will still be there). As to two simple wires working better, maybe
they're just lossier preventing some overdrive.

I blew up a mic input jack as a kid by recording off of a phone
line... phone rings, 95 Volts comes in, blammo.

tim@umcc.umcc.umich.edu (Tim Tyler) wrote:

>>Anyone who knows the CREATE antennas knows that they are overpriced;

> "overpriced" is a relative term.

I suppose so. "Relative" to all other scanner antennas, TV antennas, most good quality Yagi-Uda antennas, and even comparable amateur antennas, the Create Log Periodics are ..... overpriced. Always have been since the mid-late 80's when they were introduced.

>>are not regularly advertised in magazines, especially those "in the
>>know"; and are never reviewed by leading authorities in the field.

> I used to see the Create LPAs prominenently displayed in EEB ads
>in some of the magazines. I don't understand what you mean by

Perhaps. Perhaps not. Generally speaking, those with strong sales will advertise in the prominent rags.

> Also, I always appreciate finding out which of the radio product
>reviewers just buy the product like everyone else, and which apparently
>write to the manufacturer & request/expect to obtain one at a discount.

A regular reviewer cannot buy everything on the market. Nor even a fraction thereof. Most products can be reviewed on a "lend & return" basis, too. Freebies are not the focus as a general rule.....

>>Log-periodics for 25 MHz - 1300 MHz are......large. The Create Log
>>Periodics are.....very large. VHF-UHF log periodics are MUCH larger

> Sure, LPAs cut for 25-1300MHz are large.

Moss said they weren't.....

> Despite its size (which isn't as "very large" as you indicate,
>IMHO), the Create 50MHz-1.3GHz is relatively light (I'd guess around
>25lbs), constructed well, and certainly doesn't look march larger than

>a TV antenna once up on the roof (i.e. it isn't going to stand-out too
>much, & look like some big old HF beam...).

What.....with an 8-ft boom and reflectors of about 8-ft, that's not large? By amateur antenna standards, no. By scanner and TV antenna standards.....relatively.....and in contradition to Moss' statement, the Create LPA's are.....large.

> Hey, seems like you guys are 7-year old twin brothers to me...

I'll be derned. Really? You're entitled.....

>But from the standpoint of someone who some day might have been
>interested in purchasing one of your products, your post was an

I'll be derned. Really? You're entitled. Are you implying that I don't have the experience of ownership and operation of them?

> Anyway, for anyone out there interested in an LPA, don't be
>discouraged by the few LPA-related comments in between the squabbling!
>Bill talks a lot about LPAs & Create Industries, but the bottom-line is
>that if he needed to ask them to send him one so he could do a review, he
>apparently doesn't have much (any) first-hand experience with the Create
>LPA models!

They contacted me.....in 1987. I specified, bought, and installed several over a four year span.....for commercial installations. As far as I know, I was their doorway into the hobby scene in 1987 when I published a press release on their LPA's. Noooooooo, I guess I don't have any first-hand experience..... (good grief!)

Cool, dude. What other implications would you like to throw at me?

Bill

That is a very nescient comment. What do you mean by "ever" and "not
everyone". Getting a bit too general aren't we?

>I read your lastest issue of World Scanner Report, and you have three
>columns in there in which you explain that you cannot provide your paying
>customers with the same level of support that other merchants provide
>theirs.

I didn't say that. You said it, and it is incorrect. Is that a
purposeful skewing of the fact to suit your disguise and camaflage?

> The main reason, you say, is that ever increasing numbers of
>people are trying to rip you off. I don't know about everyone else, but I
>paid my $25 and I expect to get my money's worth.

Then get it.......or ask for a refund of all unsent issues. How is
this a problem? It certainly shouldn't be......

> When someone doesn't give me what he has committed to
>delivering, I expect to get some or even all of my money back.

You need ONLY REQUEST it if you feel that way. I don't understand,
though. Had you asked for a refund and were denied? I'll fire
someone here if that is the case. We always refund undelivered
merchandise upon request. We -=don't=- send out stuff to be fondled,
mangled, photocopied, tasted, folded, stapled, mutilated, and
destroyed and then allow refunds. No, we don't do that........

> I (and I'm sure that most of your readers too) am not
>out to "take you to the cleaners," as you write in WSR, Mr. Cheek). We're
>decent, upstanding folks--maybe just as good as you.

Two things. You are probably -=better=- than me. And I did not say
anything of the sort. Do you have a reading comprehension problem?
If so, I might could put things on audio tape for you.....unless
you're hard of hearing..... Do let me know.

>Let's look at it from my perspective. The current issue has three columns
>devoted to your less than charitable views of your customers; it has three
>columns from a lady who says her husband's scanning hobby is A-OK; and it
>has 2.5 columns on computer talk in which you say "computers are hear to

>for the address label, a plea to renew the subscription and some other
>house-keeping kinds of stuff. Add it up, and you get 20 columns of good,
>solid info out of a possible 30. If it were one issue, I suppose that I
>wouldn't mind, but it's been that way for the last few issues. WSR is
>becoming less relevant and more a platform for Mr. Cheek's personal views
>(I'm sorry, that's not what I paid for). Yet, you've already judged that
>I'm a sam artist and have told me as much in print. What hope do I have of
>getting a refund (I don't want one, by the way, I just don't plan to renew
>the subscription).

You are entitled to your views. But the details that you related
above are groundless and not based on fact. I really do suggest and
strongly so, that you request an immediate refund of all unsent
issues. You'll have it in a matter of days, no questions asked. It's
our policy.

>The point of all of this rambling is that sometimes, Mr. Cheek, you're
>wrong and the other guy is right.

Really now? I suppose you're the man to stand up and tell me, right?
Especially hiding behind your AOL screen name. Ok, so tell me how
wrong I am. Maybe I need a good putting in my place, right?

> I'm not saying that this is the case

Ohhhhhh, I see.....then WHAT are you saying?

>here--there's a lot to argue with in what I've said. But if you're not
>willing ever to concede that you make mistakes

Huh? Beg your pardon? Who said that about me aside from you in your
inference? I've never said any shit like that. Who told you I did?
I'll kick his patooty up between his shoulder blades.....

> or that the other guy's point of view is equally valid, don't expect
> me to take you seriously.

Sorry to burst your bubble, but not all points of view are equally
valid, and rarely are any! I don't know or understand the framework
of logic of where you come from, nor your particular gene pool, but
man, the sky is blue and if you say it's chartreuse, then you're color
blind or weird. Or tell me there aren't (2)(pi) radians in a circle.

Not always, of course, but often it is vital for humanity to play to
the same sheet of music....and if you depart from it, then you are
invalid.....or a green guy from Mars....or Geezus H. Kriste, maybe.

And frankly, I don't lay awake nights sweating you taking me
seriously. It's your choice and I won't dare deprive you of it. Same
as you won't dare deprive me of mine. Comprende?

Bill

I recently "accidently" overheard a cordless phone conversation in the 46 MHz range that was
scrambled. I was in Escondido, CA demonstrating to a friend the lack of security involved in using her
cordless when we came across this scrambled conversation. There was no way to make it out. It was
nothing I had ever heard before in the cordless area, and was much different than the effect you get when
multiple phones are on the same freq. I don't know if this is a new product or a custom setup, but it
sounds like the answer to your needs (if its publically available). I don't get to that neighborhood much,
but if I can figure out more I'll try to post it. Maybe someone esle knows about this and can shed a little
light on the subject.

Hi Robert,

> Does anyone know where i can purchase a battery for an aor ar900 scanner?

As you are in the US I would suggest you try either EDCO or ACE.

The **early** AR1500's used the same pack. Later battery packs for
the AR1500 had three pins rather than two so don't get one of those.
You need the pack with two pins. If you have difficulty let me know we
can help also.

As an alternative you could make your own up with 5 x AA cells. Get some
with solder tags on the end and away you go. If your old one is "duff"
you could use the lead/pin from that as the supply lead.

Dave Maxwell (dmaxwell@hookup.net) wrote:
: I am contemplating puttin up a create log periodic vhf-uhf beam for scanner us.
: I want to put it up 80 ft on a rotor to listen to uhf 150 miles away.Anybody
: out there have any experience with this antenna that can give me the pros and
: cons of it and how it performs on long distance listening.

At the Central States VHF conference last year,
a Create CLP-5130 measured

144 MHz 6.8 dBd
222 MHz 5.9 dBd
432 MHz 6.2 dBd

This is consistent with expectations--its about
the same as a small yagi antenna (3 elements).
At a particular frequency, only a few elements
of the log periodic are doing anything useful.

However, purists will argue that element count
isn't meaningful--the better indication of yagi
performance is the length of the boom--the longer
the better. Since you can fit 15 or 16 elements
at 900 MHz on a boom the size of the Create, an
improvement on the order of 8 or 9 isn't unusual.
You could do the same with log periodics--you can
extend the element spacing to improve the gain at
the expense of a bigger antenna.

At UHF, line losses can significantly degrade
reception. You can do what the TV people do,
get a preamp or "booster" that mounts up at
the antenna. If you do this, you can still use
inexpensive but good quality feedline. This
probably makes more sense than trying to buy
very low loss feedline.

>there a better radio to start out with instead? How's that price?

See the PRO-2037 review in the July 1995 (current) issue of
Monitoring Times magazine.

The PRO-2037 is the base version of the PRO-62 portable. They have
the same IFs and frequency coverage. The PRO-2037 I tested for
the review has lots of images even though it boasts up conversion
circuitry. It has good audio quality, reasonable bank size, and
supports all the basic features.

At $300, the PRO-2037 seems overpriced, but it's a better value
at $200 and certainly a good model for a first scanner.

750. Antenna for ATC

Newsgroup: rec.radio.scanner
Date: 1995-07-12 00:00:00 UTC
From: matchett@cgs.c4.gmeds.com
Message-ID: <3u0m04$8bt@mloeff01.elec.mid.gmeds.com>
Source record: 252540

I bought a PRO-23 to listen to air traffic control for Detroit Metro.
Most of the ground based approach and departure traffic is weak enough
that it can only be heard with the squelch turned all the way down.
I'm about 25 miles away from the airport, so I know about problems
with line of sight.

Does anyone have recommendations for an antenna to use for these
signals (108-136MHz, AM)? I would prefer something small which
I dont have to hard mount to the exterior of my house.

Thanks.

751. Police Call/VOR-ILS

From: wa5iyx@n8naa.sat.tx.us
Message-ID: <m2F58c1w165w@n8naa.sat.tx.us>
Source record: 252541

Since this BBS is going down Jul 15 (and along with it my access to
this Usenet) I figured that I'd give these a retry:
(1) Any recommendations on a scanner that will tune the ILS/VOR
navaids (108-118 MHz) without suffering from overload intermod
from local FM broadcast stations (in 1989 a loaned Icom R7000
even did that!) About three years ago I thought that I had
a source for some old (tube) commercial airline pullouts in
Austin but that has apparently fizzled. I need this in
connection with my ongoing studies of sporadic-E propagation;
using the overspill of an FM tuner to catch those poorly-
modulated and rapidly fading AM idents is a major pain!
(2) Anyone with recent used Radio Shack Police Call directories
they'd part with. I am particularly interested in Volumes
1, 2, and 9 as my latest for those regions are the 1981 issue!

>called Uniden and she said it was not a secure phone.

I had the same experience so I sprung for the extra $30 a got the Exp 9100 and it is a great phone. I was real impressed that the guy on the Uniden line actually knew what DSS was and which models used it.

I've tried listening for it with a scanner and you can find which channel it is currently using (it breaks the range from 908 - 923 into 23 channels and then confines the SS into the channel range) but there is nothing there to listen. All in all, a very nice phone.

Selling the following. Originally made for a Yaesu 727R, but I think will work on most Yaesu models.

Selling as a package only. Won't split it up.

Package includes:

1 Battery
1 Car Charger
1 Home Charger
1 Voice Activated Headset
1 Car Mount for Radio

Will sell for $35 plus shipping and COD fees if applicable.

If interested, email me please as I don't read the usenet very often.

Thanks!

Source record: 252545

DS>One new frequency no one seems to have yet is the new WeatherRadio
DS>Canada repeater on 162.400 out of Omemee, between Peterborough and
DS>Lindsay, Ontario

DS>Normally I can pick up peterborough (Harwood) on 162.550 and Toronto
DS>(CN tower) on 162.425. All I can get now is 162.400...
^^^

DD>This is the second time I've a message about this.

You mean you also read...

Date: 07-05-95 (17:16) Number: 1070 of 1071 (Refer# NONE)
To: ALL
From: DAVID SHEARMAN
Subj: New WeatherRadio canada Station
Read: (N/A) Status: PUBLIC MESSAGE
Conf: Main Board (0) Read Type: GENERAL (A) (+)

I've not been able to pick up WeatherRadio Canada on 162.475 (Toronto)
^^^
or 162.550 (Peterborough) because of a new repeater in Omeemee at
162.400. What's worse, if gives the Peterborough weather, not the
Toronto weather, which is prevailing where I live in Durham Region.

Anyone heard anything more about this?

...? <g>

DD>I live in the North East corner of Scarborough and get
DD>162.400 being transmitted from the CN Tower with the
DD>"studio" being in the Toronto weather office.

DD>And at the moment all I get on 162.425 is static.
^^^^^^
That means thunderstorms!

Well Dean, I don't know what David has been listening to all
these years (since in one message he refers to WX4, and in
the other, it's WX3).

As you know, XMJ-225 (Environment Canada, Toronto) is on WX2
(162.400). (It used to be on WX3 (162.475) a few years back.)

WX3 currently carries VAD-320 (Environment Canada, Niagara),
and I'm not aware of any Environment Canada weather stations

on WX4 (162.425).

Given all this, I'll assume that David has been listening to
WX1 (Peterborough) and WX2 (Toronto).

The new station in Omemee (on WX2) probably replaced the
Peterborough station, and is wiping out the Toronto station,
which is also on WX2. This scenario would leave David with
only one source for weather.

Next question? :)

...Andy

Source record: 252557

I am considering following through on the developement with an Infra-red
remote for the PRO-2004/5/6 series of scanners. This will allow wireless
remote control of all front panel keypad fuctions from the other side of
a room (just like your TV remote). This could co-exist with other
3rd party computer interfaces.
My hardware is ready to go, I just need to write the firmware but before
investing the time I'd like to get a feel for the demand.
I will endeavor to keep it "affordable" but would like input on what you
might be willing to spend on such an add-on. I will also attempt to use
a remote that is standard and readily available so that you could supply
your own if desired.

Please send e-mail feedback to: hduff@humnet.westonia.com

Thanks ! Hugh Duff VA3TO Toronto

I just finished serving as a Grand Juror (hear 20 cases per day, decide to indict or dismiss charges).

In two cases, a judge had to excuse me because I had heard about the case on a scanner. No disapproval of me (except maybe from the prosecutor, because he had to do a hearing before the judge to excuse me) at all. In fact, I had to tell the judge what I'd heard so that he could make a decision.

779. Does the DB32 antenna have a BNC connector?

Newsgroup: rec.radio.scanner
Date: 1995-07-12 00:00:00 UTC
From: wired@genes.pl.my
Message-ID: <805547698.20530snx@genes.pl.my>
Source record: 252569

Or does it have some kind of propreitary connector? Can I use it for my MiniCounter Model 3300? How's the performance?

Why do I always get readings around 300 and 700 MHz on the counter even when there is no antenna connected?

What would be the best all rounder (2m, 70cm and cellular) antenna?

One more thing - can the DB32 be used on a scanner?

thanks!

>to know what frequency the conductors monitor and use when talking to
>the engineer and switch yard.

Amtrak uses 160.455 for in-yard switching, but outside the
yard they probably use the frequencies of the line they are
running on (Santa Fe, Union Pacific, etc.). The actual
frequencies will usually be different depending on the
stretch of track. The best source of rail information
in Southern California is Sam Pottinger's Rail Maps and
Guides. They give you topo maps, yard and track locations,
good photo sites and directions to them, typical photographs,
equipment rosters, and the ever-popular frequencies. I have
the guides for Los Angeles, Tehachapi, and Cajon Pass and
am very happy with them. The Los Angeles guide alone lists
24 frequencies, but I haven't tried to monitor any of them
yet. I don't have anything south of Los Angeles, so I
cannot answer your exact question. For current prices
write to:

Sam Pottinger
Steel Rails West
P.O. Box 59117
Norwalk, CA 90652-0117

Tell him the areas you are interested in and I am sure
he will be able to help you. They are everything a
rail freak could want. Tell him you were referred by the
Los Angeles Live Steamers.

>
>No "flaming intended...only information"
An additional couple of thoughts...
Try your local library. In Lexington we have 3 libraries that have
the CFR(?consoladated federal registor). All of the FCC rule books
make for interesting reading. For instance(I don't have the exact
rule in front of me)any public saftey(police) can operate on any
frequency assigned to public saftey from 30 to 500Mhz with a max
power of about 2 watts. Stake outs might show up on several starnge
freqs.
There is also a lot of fudging going on. Groups/bussiness can gain
access to some frequencies by being creative. I have heard (IMHO)
improper bussiness on improper frequnecies. Just dream up a theatrical
connection and locate your catering service in the motioin picture
area.
Or dream up an "energy" connection and gain access to all those low VHF
30-50 Mhz that are reseverved for "energy producers"(ie petrol drilling,
refinning, transportation exploration) I heard a civil engineering co
several years ago operate down there. I new the owner and he admitted
that he had absolutly nothing but a paper conection with energy
production.

There is a 12 Vdc jack on the back of the unit. Assuming you can buy or make the required cable, you can run it on vehicular 12Vdc, or a 12Vdc battery pack. How portable and lightweight it is, as well as how long it will power the scanner, is up to you and how big the battery <s> is <are>.

Just an FYI. The frequencies used at the Capitol probably won't change but the California State Police will cease to exist soon. Their functions and personnel are being merged into the CHP. New freq guides might reflect this soon - so don't be surprised if you can't find state police freqs next year.

I think the merge will be effective within a month.

From: jeff.lackey@channel1.com
Message-ID: <40.24264.2433@channel1.com>
Source record: 252577

After reading a major slam on Bill Cheek, let me just put in my two cents worth:

I've been helped more times than I can remember by Bill over on the Fido net (lost my Fido source this year, so I was hoping to see Bill show up here on the net). He has ALWAYS bent over backwards to help anyone who is half-way reasonable in their requests. He's saved me many, many dollars with his answers and comments. I purchased both of his scanner mod books and had a great time turning my 2006 into a much better scanner than when it left RS.

Does Bill have his opinions on matters other than scanners? Sure, he's a bright guy. Has nothing to do with his technical expertise and advice.

FWIW,

>I saw a comment somewhere about them moving to the 800MHz
>region, but I haven't scanned that range yet.

Since Portland has been switching over to the 800 trunking system,
they have been doing simulcasting on the old 400 network, because not
everybody had the new radios. As the old radios are replaced the
simulacasting on the 400 freqs get cut. I'm guessing that the old
North Precinct has finally replaced all of their radios and that they
no longer used 460.100 anymore.

Wonder what the city is gonna do about those freqs now that they don't
use them...

From: Bruce Rogers <brogers@indirect.com>
Message-ID: <3tvcof$env@globe.indirect.com>
Source record: 252617
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

During the last shuttle mission NASA select audio was rebroadcast on the 145.29 repeater.

Also, the ATV folks had live video most of the time on their Shaw Butte repeater. The output
freq is equivalent to cable channel 57 and can be seen on a cable-ready TV with a decent outdoor antenna pointed at the mountain.

>are. I dunno if that is good or bad.

You're blowing smoke where there are no sparks. I knew of and dealt
with Create long before you ever knew of them. If you don't like it,
that's one thing, but don't redirect the subject matter out into left
field to suit some perverted purpose.

You're simply in the "attack" mode like Moss.. Your tactics are cute.

>>Cool, dude. What other implications would you like to throw at me?

> None, because you're doing a mighty fine job of that yourself, champ!

One thing for sure, Chump, you're entitled to think for yourself.
Question is....had you ever considered hiring someone to do your
thinking for you? Might be worth a thought. Hard to tell where
you're coming from except that you own a Create antenna and somehow
perceive me as having attacked it.

So obviously, your antenna is a prosthetic device for some dimunitive
member of your magnificent personage which othrwise is far above and
beyond this ordinary mortal's.

Do you walk on water?

Source record: 252621

The homebrew antenna I use is a 48 in top loaded fiberglass cb
antenna with a 3/8 X 24 thread base (radio shack) this screws into
a mount that accepts a pl259 connector there are 4 more rods that are
a quarter wave (thereabouts) 2in for 900 mhz, 6in for uhf,18 in for
hi band,and 22 in for aircraft band.Each 1/4 wave rod has a solder
lug large enough to fit over the 3/8 stud base of the cb antenna
on one end.
Slip all four lugs over the 3/8 in stud screw the antenna into the
mount bend the elements upward spaced equqly arround pointing upwards
so it looks like an umbrella after a storm.Its cheap and works well.

I had a 980 once but decided not to keep it. It was an ok scanner performance wise but nothing special. I ended up returning it to ACE because they had advertised it as coming with a case, adapter and nicads. It came with just the radio. A call to ACE said their ad was in error and they would not reduce the price. The radio also used AAA batteries. I also felt that for the price there are better radios out there. If you want the completely uncut version they are available from over seas sources for a similar price to ACE. It was not a bad radio and had it not been for the ACE ad problem I may have kept it. The audio was fair, intermod a problem in the city but minimal out in the burbs where I live. Sensitivity was ok and it picked up everything I listen to. It is a nice size a little smaller/skinnier than your average hand held.

The OS 456 works just fine without the PC hooked up. You still have to load the frequencies by hand though. The OS 456 only scans the frequencies in the program you use. I use the OS 456 with Probe software from a company called Datafile and really like the combination. Probe's frequency and bank management is great and it can upload PerCon CD FCC files.

799. PRO-2004 Problem Fixes

Newsgroup: rec.radio.scanner
Date: 1995-07-12 00:00:00 UTC
From: jsgill@axess.com
Message-ID: <3tvf4u$6a3@news.axess.com>
Source record: 252627

First I would like to thank all the helpful people who posted and Emailed fixes to my problems with my PRO-2004. I was able to solve both the problems detailed in my previous post. because of some confusion that I had, I thought I would share my experience with the repairs.

First the Audio Problem:

The audio problem was solved by replacing the .22 uF mylar capacitor (C214) as opposed to C213 the 100 uF electrolytic. I replaced the mylar with tantalum for improved stability.

The second power on problem was not electronic, but physical. The linear component board seems to be very prone to physical distortion due to temperature and/or humidity. It would also seem that there could be early versions of the PRO-2004 that were poorly soldered. Resoldering any bad looking joints and carefully installing the board back in (ie one screw at a time checking for functionality) and omiting the offending screw worked for me.

I hope that this is of value to other PRO-2004, owners who are the proud owners of luminous boat anchors.

There was mention here of a commercial on the Discovery Channel about a 900 number to listen to pre-recorded tapes of emergency incidents.

It was called Code Red. I contacted the advertising department of the Discovery Channel and they said it's not one of their national accounts. They said it's probable that the commericial was a local one, run by the cable operator in your area.

If the original poster locates the service or 900 number, please post the information. I'd like to find information on the company for an article in DISPATCH Newsletter. Thanks.
Gary Allen

Do you want to cook without heat, too? ;-)
Seriously, you have remioved the best options with your last sentence.
The best alternative open to you then is to find an antenna that will go on
your '23 that's cut to the particular frequencies you want to listen to. AM
or FM makes no difference to the antenna, so it's just the freqs you need
worry about.
My advice would be to find the phone numbers of the various antenna makers,
and ask them for what they have in a whip with a BNC connector, for use on
the 108-136 MHz band. The various radio makers could help you, too.
Good luck.

I hate to bring you bad news, but you may never see mods to enable the
cellular freqs for this scanner. The 2030 could receive the images because
it was not triple conversion, like the 2037.

>This could be a Motorola cordless phone with secure clear.

I'm quite sure it was. I've never seen a 46/49Mhz phone that was digital or
that used type of scrambling other than frequency inversion, which is what the
Motorola Secure Clear phones use. Frequency inversion is cake to decode.
There are descrambler kits available and I know of one scanner (the AOR8000, I
believe) that actually have a frequency inversion receive mode. I can also
receive inverted frequencies with my Yupiteru 7100 scanner by putting it into
SSB mode and tuning a few KHz off frequency. In other words, frequency
inversion gives you nothing close to the type of privacy that a digital spread
spectrum phone will.

I had the same scanner with the same production code you listed. I
did these mods and it worked beautifully. Good luck....

Have you tried the 'brown wire' mod? Of course, keep in mind that
it is not legal to listen to other people's telephone conversations with
radio and/or scanner equipment. This modification is provided for
information purposes only, not as an attempt to encourage people to
commit illegal acts. No warranty is offered, or should be implied.

PRO-46 Mod for 'unmodifiable' version

The old pro-46's could be modified for direct entry of any 800 megahertz
frequency by removing one surface mount diode, and moving another.

Since then, the pro-46's internal computer has been modified to ignore
the diode change, and the user was forced to use internal test modes in
the radio in order to receive 850 to 899 Mhz which includes the base to
handset cellular frequencies, among others.

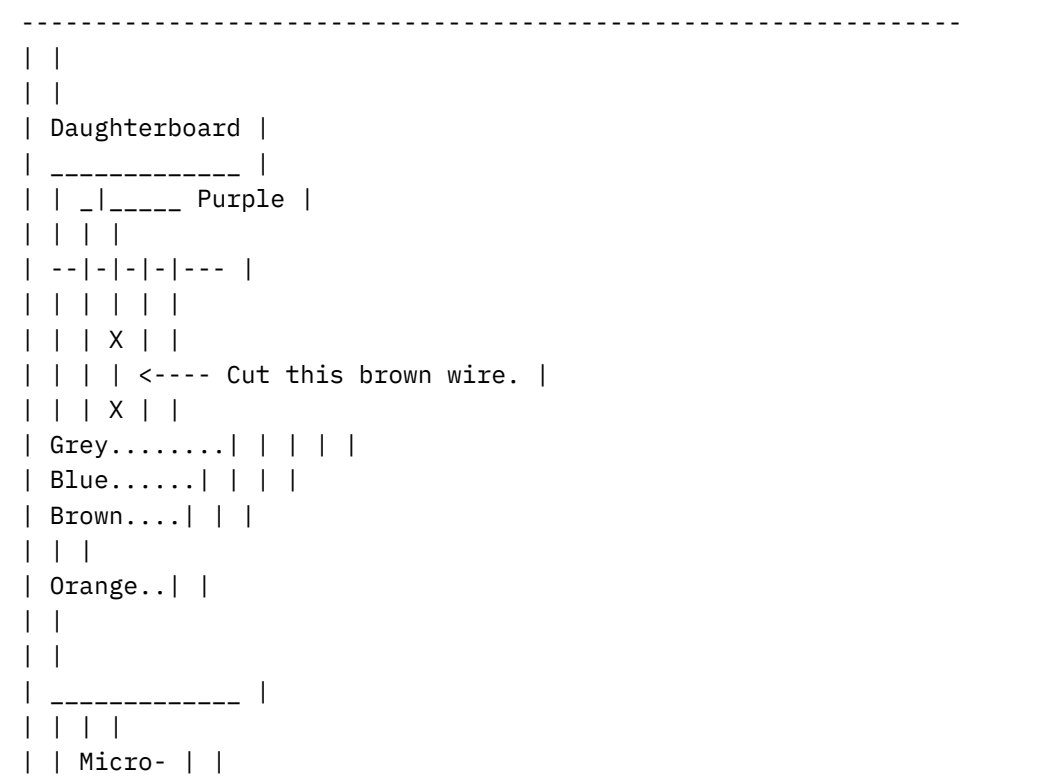
When Tandy found out that people were using the test modes (invoked by
pressing certain keys while turning on the radio) they had several models
of radios including the pro-46 shipped back to the factory to disable
the test mode that allowed access to the cellular base-to-handset frequencies.

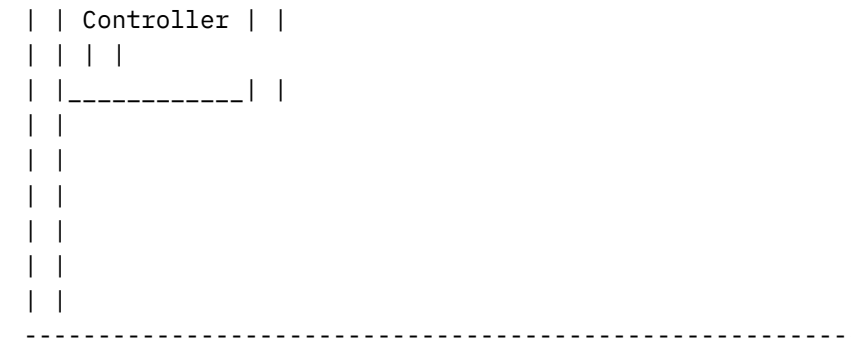
If you have one of these factory re-modified radios, you can still access
cellular base-to-mobile frequencies by disabling the factory re-mod. This

will enable the keyboard test mode again, and then you can use the keyboard test mode to access the 850 to 899 Mhz. To disable the factory re-mod follow these steps:

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards next to the interconnect plug in the lower right corner. Gently pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor and set it aside. ** CAUTION!! Too much heat will damage the shield. **
5. Locate the newly attached rework daughterboard adhered to the board above the microcontroller chip. The daughterboard has five wires coming from it, four across the bottom, and one on the right of the daughterboard.
6. Find the third wire from the left on the daughterboard, (this is usually a brown wire) and clip it.
7. Reverse steps 1-4 to reassemble the radio.
8. Perform the keyboard test mode mod as described at the end of this file.

The daughterboard is about one inch wide and 1/4 of an inch tall. It probably has a piece of black adhesive tape over the top of it and it has four wires on the bottom of it (Grey,Blue,Brown,Orange) and on on the right of it (purple). It looks like this:





The rework disable mod is known to work on the following pro-46:

serial number: 450330xxx
model number 20-305
Fcc-id-AAO20-305A
and a white label that says merely: 5A4

==========
Modification of non-daughterboard model pro-46 by using keyboard test mode
==========

~From: dbarton@moe.cc.emory.edu ( )
Greetings. Since there have been some requests lately I thought I would repost this spiffy mod for the Pro-46. This will not restore full 800 MHz coverage, but it will restore the hole b/t 868.9375, and 896.1125 with straight 30 kHz steps. All standard disclaimers apply, including but not limited to the following:

It is not legal to listen to other people's telephone conversations with radio and/or scanner equipment. This modification is provided for information purposes only, not as an attempt to encourage people to commit illegal acts. No warranty is offered, or should be implied.

PRO-46 TOUCHPAD MOD

This mod will give you access to several frequencies not in the Pro-46's normal scanning range. It will require you to erase all currently entered frequencies, so I suggest that you write them down on paper *before* you begin this process.

1. Turn off the power.
2. While holding down the 2, 9, and L/Out keys, turn the power back on.

This will erase the currently entered frequencies, and input freq.s into the first 25 memories. Of particular interest are the freq.s in the following memories:

#14: 66.450
#15: 76.825
#16: 87.425
#23: 888.96

Each of these freq.s is outside of the normal scanning range of the unit. #14 and #16 are in the TV range, #15 is in the land mobile range, and #23 is in the cellular range.

To use any of these freq.s, first store them in a monitor memory,* then once you have reprogrammed your scanner you can place them into a regular memory. You can then use the manual scan feature to search through the ranges these frequencies give you access to. You still cannot enter frequencies in these ranges manually, but any freq. stored in a monitor memory can be transferred to a regular memory. Best of luck.

*To place into a monitor memory, open the squelch all the way (so you hear static) and push one of the arrow keys. This will start the manual scan feature, but the frequency should not change because the squelch is open. You can then press the Monitor button to store the freq.

Permission is hereby granted to copy, transmit, archive, or send this

file by any medium as long as it is reproduced in its entirety. Many thanks to those who submitted the info originally (sorry I lost the names).

--

Modification of older model pro-46 by moving surface mount jumpers.

==========

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This product uses surface mount components which can be easily damaged. Do not perform this modification if you are not experienced with this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards next to the interconnect plug in the lower right corner. Gently pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor and set it aside. ** CAUTION!! Too much heat will damage the shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder and remove both.

6. Solder one chip jumper across the two upper most unused solder pads. (Soldering a jumper across the lower two pads changes the 30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

I have one that picks up our local Television sound carrier really
well on every frequency from around 500Khz through to 900Mhz.

It might be just this particular one (i hope so) taking it back to
suppliers on wednesday)

information about this problem.

Location Manchester UK
interference from BBC1 Sound carrier from the Winter Hill Transmitter
740 odd Mhz

When I was a kid living in Buffalo in the early eighties there was a
massive sonic boom in the early morning which woke up the whole city and
made all the news broadcasts. Everyone instantly blamed the
Air Force Reserve unit in Niagara Falls, which initially claimed that it
was not them. They soon admitted that a flight of six of their F-101
Voodoos had "accidentally" exceeded the sound barrier over Lake Erie at
six AM.
They were due to retire the Voodoos the next week and I doubt that there
was anything accidental about it.

I, of course, slept through the whole thing.

I have tried listening my PRO-39 using the headphone(stereo w/ Mono-Stereo converter) and I heard quite a considerable hiss in the background. Is there any mod to reduce the high freq hiss from the audio output? Any experiences with the private listening would be appreciated.
Thanks for your consideration.
Sincerely,
Bishwa Shrestha

> The image trick works well with the bc200 hand held

It works EXCEPTIONALLY WELL on the new $300 Standard C508A micro-sized
dual-band amateur radio handi-talky.

This is advertised as a micro-sized amateur radio HT with a 250 milliWatt
transmitter good on both the amateur radio 2-meter and 70cm band (great
for hitting near-by repeaters, very local simplex use or cross-band
repeating through the high-power mobile rig in your car). It runs
on two AA cells. No numeric keybad, but you can get around easily
and quickly enough once you read the manual.

What they don't advertise is that this baby also gets 800/900 MHz.
Direct cellular access is blocked, but it's got a dual-stage IF
with up conversion so the cellular band appears between about 915
and 940 MHz.

I SWEAR it receives cellular so well (and adjustable to the proper
30 kHz steps) that you'd think that was it's main function!!

It also works great on the UHF public service frequencies. Does OK
with aircraft-band AM too. Works like crap on the 162 MHz NOAA weather
band. The antenna is REALLY tiny. I suspect that is the reason. As it
is, it's best from 430 MHz and up.

Good thing cellular is blocked! I hate accidentally stumbling across
those frequencies. Discovering the side-effects of dual-conversion
designs is, of course, only a technical curiosity of mine. ;-))
Perhaps congress will outlaw dual-conversion superheterodynes next??
Politicians -- don't ya just love 'em??

Seriously, my wife and I are stuck with AMPS cellular here in Milwaukee
for now. We are aware of it's limitations and never discuss serious
matters or provide private info while using cellular. I look forward
to TDMA (and maybe CDMA in the future) in the Milwaukee, WI area.

It is unfortunate that politicians would seek to outlaw direct access
to the cellular band in scanners so as to provide a false sense of
security, when in fact, the typical side-effects of superheterodyne
circuit design make it so easy to intercept anyway.

Lafayette, IN was thoroughly boomed a little while ago, and reports are coming in from all over Tippecanoe county, IN about it. Evidently it was a real good one, because half the cops and fire depts. in the county were scrambling looking for missing buildings or large craters....

Having found none, they have come to the conclusion that it was a sonic boom.

A local radio station contacted the ANG base in fort Wayne to ask them if they knew anything about it. The quote on the radio was "sonic booms do sometimes occur over Lafayette".

Yeah, about once every 5 years. I noted that this ANG group did NOT claim responsibility for it. There are only two groups in Indiana that could, ANG TFG's at Fort Wayne and Terre Haute. I doubt that the KC135's at Grissom AFB are likely to have done it.... :-)

(noting that there are several F16 groups in Ohio, too.....)

What I'd like to know is if anyone in surrounding areas/states either heard the boom or heard anything on their scanners/other radios about it. It would be interesting and amusing to see if we can pin this one down....

email to: wb9omc@harbor.ecn.purdue.edu

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 110 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when | the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in

R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal | controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high | bands. 117 VAC only. Wood covered particle board cabinet. |

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and | UHF bands. 117 VAC only. Wood covered particle board | cabinet. |

Bearcat 12 (Electra): 1979 vintage. One of the last decent | crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for | Electra by competitor GRE (General Research Electronics). | The only crystal controlled base/mobile Bearcat scanner | offering 118 - 136 MHz AM aircraft band. 10 channels. |

BC101 (Electra): 1975 vintage. First Bearcat synthesized | unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after

looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable | number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. A BC220 but with 40 | channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in | features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal | cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor

Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line | scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. | Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. | Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz

on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," | by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top | unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat | BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May | 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The | Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, | in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using | up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. | See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, | in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel | portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT | through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel | portable with 20 banks. Up conversion. Very fast scan,

search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel.

User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: 1986 vintage. Top of the line, wide band scanner | for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The | Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass | AJ9S, in The Radio Enthusiast, February 1987, and | Monitoring Times, March 1987.

PRO2005: 1989 vintage. Essentially a size reduced PRO-2004 | with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. | See "Product Review: The Radio Shack PRO-2005 Programmable | Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, | June 1989, and RCMA Journal, August 1989.

PRO2006: 1994 vintage. Essentially the same as PRO-2005 | but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob | Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage. Cumbersome 100 channel bank size. | Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. See "The Radio Shack PRO-2035 - How Does It | Compare With the PRO-2006?," by Bob Parnass, AJ9S, in | Monitoring Times, January 1995.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells.

Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The | Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, | in June 1995 Monitoring Times.

PRO-2037: Triple conversion all plastic base scanner made | by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The | Radio Shack PRO-2037," by Bob Parnass, in July 1995 | Monitoring Times.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner

despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. Audio suffers from small speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, |

AJ9S, in Monitoring Times, February 1995.

PRO43: Good portable 200 channel scanner using up conversion. Covers military air band. Selectable AM/NFM modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: Only 4 channels in this crystal controlled | portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob | Parnass, excerpted in the "Technical Topics" column, RCMA | Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off

frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from Federal | Signal in University Park, IL, and may be available in the | future from:

Woodson Electronics/Plectron |

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In |
the mid 1980s, Uniden, a Japanese company, bought out the |
Bearcat scanner line and Uniden's first Bearcat scanner was |
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and |
1980s although some of the capacitor failures occur in the |
Uniden BC800XLT, too. |

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483. Uniden currently charges
a flat rate of $54 for scanner repairs. They will repair
and return "out of warranty" items without an estimate
unless the repair charges exceed the flat rate charges.
The phone number for repair is (800)297-1023.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |

Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Common Construction |

Most of the classic, metal-cased Bearcat base/mobile models | were built using two printed circuit boards: |

1. a "radio board" containing the synthesizer, RF, IF, | and audio stages, and |
2. a "feature board" containing the microprocessor | controller and memory circuitry which gave each model | its own personality. |

Athough there are various vintage radios boards, they all | have similar circuitry. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had

been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've | fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display

Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., | BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an | internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip

connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor.
Another problem is when none of the keys seems to function;
the receiver just keeps scanning in spite of key
depressions. I found this condition in a BC210XL scanner
owned by a heavy smoker. Perhaps nicotine smoke was to
blame, as the resistance between two input port pins on the
microprocessor was down to about 1000 ohms, fooling the
microprocessor into believing that a key was stuck in the
"down" position. Scraping the circuit board between the
two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics |
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Hello! That is a very simple question to answer. By "point 7" they mean use the frequency such as 123.700. Point means decimal point. I have heard something like "contact tower point 25". That would mean .250. The zero is never mentioned.

Besides having a very serious intrest in scanners,I also love aviation!!

I find it hard to believe RS would sell a 200 ch triple conversion unit for $199
on sale. This is a typical price I've seen of their double conversion
stuff. I'd have to check the catalog/advertisement on the type of
conversion (or maybe ask the salesman? ha ha).

Without seeing the ad, I'd guess the 2037 is a replacement for the previous
2032, which was a 200 channel desktop unit, double conversion...
and easily modifiable for 800 Mhz :)

The only catch is the 2037 probably compiles with FCC regs and is not
easily modifiable.

>Thank you!

You didn't state a price limit so the "best" antenna remains an open
question.

I've found that using a 20 meter (14 MHz) ground mounted vertical
antenna, designed originally for ham radio, works great in the
42 MHz range and is competes well with an Antenna Specialists AV-801
mounted at about 20 feet.

The vertical is actually a 3-band trap design, the HyGain 12 AVQ
and the 20 meter portion is operating at three times its
design frequency when I'm listening to the state police at 42 MHz.
I doubt it has the bandwidth to cover the entire 40 - 50 MHz
range with uniform performance.

It is at DC ground so one need not worry about receiver damage
due to static charge buildup.

Don't run out and purchase a new 12 AVQ at list price just for
scanner use. Hamfests are a good source of used vertical antennas,
and this 12 AVQ was a $15 hamfest special.

Maybe yes, maybe no. I don't know anything right off about the 2011
so that's the biggest stumbling block.

>In one of your previous replies you say the CD 232 is adaptable to the
>Pro 43, although this unit does not lend itself to "2 way" interfacing.
>Can you explain this further please?

Sure. The PRO-2004/5/6 scanners are designed with a CPU to do one
thing and a totally separate LCD driver chip to drive the Display
module. The CPU has to feed serial data to the LCD module in order to
tell it what to display. We can physically intercept that serial data
flow; decode it; and retrieve display data for sending back to the PC.

That's nice.....we call it the data acquisition mode, which stands
apart and separate from the control mode which programs the scanner
from an ASCII text file.....and more or less bypasses the CPU in a
sense.

There's the rub now, because all other scanners use a CPU that also
houses the LCD Display Driver....all on a single chip. There is no
serial data path to intercept for that data acquisition mode. No
problem with controlling the scanner remotely, including
AutoProgramming from an ASCII text file, but it is not possible to
acquire display data to send back to the PC for logging and further
processing.

Thus, the CE-232 is capable of "full 2-way" control and data
acquisition with the PRO-2004/5/6 and only 1-way control with all
other scanners. Only the PRO-2004/5/6 have an accessible serial data
path together with the requisite clock (SC), command-data (CD), and
chip select (CS) functions that it takes for data acquisition to be
possible by that means. Other scanners can only be programmed and
controlled by the PC but no data acquisition.

Clear as mud? :-)

I recently bought a Tropez 900DX with 900MHZ, digital and scrambling.
Works great. Tried to listen in with my PRO2006 and all I got was noise.
Not mucch more than most 900 MHZ cordless and worth the difference (they
sell between $10 and $300)

Radio Shack recently installed a new keypad on my Pro-43 and now I receive some broadcasts a little off frequency. For example, 46.83 (cordless phone) comes in on 46.825 only and 145.70 (ham) at 145.675 only. It seems to have affected a small portion of the spectrum because most of my freqs in memory have not been affected. Does anyone know what is going on? I obviously need to return the unit again but would like to know what may have happened.

DM> it really work?

Well, they do what they say they do.
They do NOT, however, tell you that there are *NO* officers nearby.
They will tell you if any officers are using their extenders locally. That's
all (aside from other normal scanner actuivities, of course).
Any decent scanner can tune the same frequencies, of course, so this is
nothing special. The hype is designed mainly for those who think it will act
as a "Police Finder", which it won't do.

GOOD NEWS! The scanner won't be able to tell the difference between 50 ohms
and 75 ohms, so use the standard TV transformer.
If working with a transmitter, the difference would make a difference. Since
scanners are only receivers, no problem.

B> to me.

Bill, you will probably receive a lot of answers to this question.
However, let me give some free advice (and worth every penny of it!!).
Relax. Who cares if *we* think it's a good scanner. It's what *YOU* think
that counts.
You say that this is a new hobby. Great! But, think back to when you started
SWLing. You started out knowing NADA. ZIP. Squat. Your first SW radio was
probably not your last. Why? Because you didn't know what you wanted yet.
SO, what do you listen to now? Utes? Military? MW DX? Diplo? FAX? Tropical
DX? See, there are are all kinds of SWLing. You pick your SWR to match your
desires.
Scanning is the same way. Go buy a scanner. Any scanner. Which one really
doesn't matter, because you will want to get another to suit your style
later. But now, you don't know what that style will be yet.
Do you want a base model? Handheld? 100 channels? 200? Stock antenna?
Rooftop antenna? Need triple conversion? Alphanumeric readout? Computer
controlled?
There's no way you will know all this yet. It takes experience. So, relax
and enjoy the learning process. See what's out there. Get Monitoring Times
and/or Popular Communications. Send for catalogs. Maybe read a few books.
Get Police Call & Beyond Police call. Listen to *EVERYTHING*, and see what
bores you. Don't listen to what bores you. Learn what really turns you on.
Then learn more about *THAT*. After you've done all this, it''s time to look
for that SPECIAL scanner that will help you do what *YOU* want to do. Then
you will realize that the scanner is only a tool, to help you do what *YOU*
want to do. The scanner itself is important only for what it can do *for
you*, not in itself.
The important thing is to relax and enjoy. Forget what scanners WE use. We
all have our own little worlds, and we all like *OUR* scanners, but that
doesn't mean that you have to like our scanners. What we like just isn't
important to you (or shouldn't be).

Is it a good scanner? Well, does it do what you want it to do? If so, it's a good scanner. In six months, you may find that it's a pig, but that's then. This is now. Is it a competent scanner? Yes. 200 channels, triple conversion, good coverage, dual power sourcing. A good first choice. And the price is hard to beat.
But remember, that's MY opinion. It's YOURS that counts.
Enjoy.

Source record: 252456

raiyden10@aol.com wrote:

>Are there any modification that can be made to new Radio Shack scanners
>(from current catalog) to allow them to monitor cell phones? Thanks

Not on your life! A combination of the law and pressure from the
cellular industry has resulted in removal of cellular coverage from
all scanners to be sold in the USA. The law stipulates that scanners
must not be easily modifiable to restore that coverage. Not only are
scanners covered under this law, but so too are all receivers, namely
the world class receivers from ICOM, Kenwood, Yaesu, et al.

The law went into effect on April 24, 1994, after which only existing
stocks of older receivers could be sold. That was over a year ago.
"Existing stocks" are long gone now. Radio Shack was the first to
make sure all new stocks were cellular-incapable.

So if you want cellular coverage, you'll have to buy an older scanner
that has it or has the capability to be modified for it.

In other words you are always right??? Have I got that straight?

: After many years of dogged effort, I have become an honest man and
: want nothing that's not mine or that I can't get on my own.

THIS IS A BLATANT, BLACK-FACED LIE CHEEK AND YOU KNOW IT!
You are far and away the biggest two-faced asshole that I have ever
had the displeasure of meeting in cyberspace.

I have
: overcome common envies and lusts for other people's property, wives,
: and fame. If it ain't mine, I don't want it. With that in mind, I
: will not tolerate being called a criminal or having my motives too
: seriously challenged like Andi Moss recently did. More on that weenie
: later in this article.

Cheek, you're breakin' my heart. <boohoo!> Criminal? Gee, sounds like
the guilty mind to me, Butt Cheek. BTW, you spelled my name wrong there.
Perhaps you'd like to explain why? I have a rather interesting Email
from you that I'd just *love* to post here for all to see.

I stand by everything I wrote and there's nothing you can do about it
because you know damn well it's true.

: I have achieved a great balance of freedom and a sense of self-worth
: and I like me for who and what I am.....which, despite any egotism
: displayed in my book.....is basically nothing of any great meaning
: to anyone other than myself.

Oh, it means a lot to you alright!

: You cannot possibly know how far I have come in four years, but if you
: have seen Vols 1 & 2 of my books, and then Cheek3......you will see a
: great distance between them. I traveled that distance in my own
: moccasins and it was painful every step of the way.

Yeah, I guess it's painful when you step all over people to try and
get where you want to go.

: Oh.....not that Cheek3 is one for the history books. It is not. It
: is only my "masters thesis".....a compendium of information and bits
: of this and that to lay the framework for what may come next. I
: challenged myself to set a standard.....and then to beat the living
: shit out of it on the next effort. That clearly means this one is not
: perfect. At the same time, it challenges other publishers and writers
: to beat it.......if they can.....and to be perfectly frank: I hope
: someone does!!! Nothing inspires me more than to have someone
: overtake me and dust my britches. Ooooooooooohhhhh!!

What a right bunch of cobblers......YOU just HATE to be UPSTAGED Cheek!
It's shows up time and time again! It's so easy to get your back up
it's laughable.

: On the other side of the coin, Andy Moss brought into this virgin
: arena an axe to grind from another realm where he was forbidden from
: any further grinding.

I beg your pardon? For anyone on the net that could be bothered reading
this far this is a very long story but Mr. Bill Cheek (aka Butt Cheek)
not only threw the first punch he has ignored peace-offerings and has
done everything in his power(which isn't much) to gag me. Cheek is never
wrong in his own mind. Even when he is blatantly wrong he won't admit it
and he makes himself look like a fool every time.

Moss has nothing to offer this forum
: or this hobby of radio, but he apparently seethes with venom and envy
: over every move I make.

Total nonsense. Envy? Sounds like that Cheek ego happening again.
I am not envious of you at all, Cheek. Cheek, in case you have not
noticed, I am absolutely NOTHING like you and I have no desire to be
anything like you. You don't have ANYTHING I want nor will you ever!
Your head is so swollen I often have to wonder if it's all an act for a
few laughs!! The pathetic part is that you are real and you really are
like this.

: I suppose I have a few enemies, and he is one.

Right on both counts! Now, why would that be I wonder??? Hmmm.....

: forum and this world are plenty big
: enough for the both of us under certain well defined rules that we all
: are generally expected to play by. But he broke those rules, and I
: will not shrink and shrivel under his attack.

Nonsense - this is a complete and total lie. If anyone has access to the Fidonet Scanradio conference go check out the shenanigans of Bill Cheek and his (now permanently departed) cyber-friend Roger Cravens. Also be sure to check out my input on Fido for comparison if you have any doubts. I don't feel like cross-posting any more of that stuff here.

: sent packing. But since THAT is Moss's sole objective, and perhaps
: the objective of a very few others,

And the list is growing Cheek! Folks don't need me to prove to them that you are a complete two-faced asshole. Nobody needed to point it out to me initially. You do a great job on your very own!

I aim to take everything they dish
: out....and then slap a wad of snot and boogers outa their noses and
: feed it to 'em for their time and trouble. I've never been given to
: running in real life so let it be etched into stone that I am not
: going to run in cybermedia.

Well, I'm still here so keep slapping away.

: And yet, I am nobody. Just a regular ol' dude who walks in his own
: moccasins; signs his own checks that don't hardly ever bounce; puts on
: his britches one leg at a time; sinks in water more than an inch deep;
: and eats off his own dinner plate. I write books and I know a little
: something more than the average bear about this hobby and business of
: radio. But I don't know shit from Shinola about racing engines;
: architecture; banking; women; and politics.

Ahh.....how sweet......you're making me feel warm all over....8-)
Careful, you're getting your keyboard wet with all those tears.

: Oh.....and I rather enjoy a good peeing contest now and again.

Sure, as long as you win you enjoy it. You haven't won this time nor are you going to. Keep it up!

: Bill Cheek
: Nobody....

I totally agree!

BTW, your rebuttal to my Log Periodic reply is totally bogus, dude! Do yourself a favor and check out how a TV masthead antenna is made and you'll see why I am right and you are completely wrong. The point which I made, you missed and others understood, was that the VHF TV antenna is actually
two log periodic antennas on one boom. One is engineered for the VHF low band and the other the VHF Hi-band. You know, the frequencies that 99% of people with scanners never listen too. Check your theory on how a LP antenna works before you go rambling on again about such nonsense. BTW, the last time I checked silver connectors were not only cheaper than gold but they had lower resistance and are more popular on antenna connections anyway.

And considering that I don't even consider myself an antenna man, I'm amazed that you would have the audacity to try and redeem yourself after uttering such el crapola.

Cheek, shut your fat gob before you get piss off someone that will hurt you.

Cheers!

Andy

858. Send me your PRO-46 Mods!

Newsgroup: rec.radio.scanner
Date: 1995-07-13 00:00:00 UTC
From: gdruebsamen@vms4.sci.csupomona.edu
Message-ID: <1995Jul13.111932.1@clstcs>
Source record: 252459

Hello,

I have a pro-46 scanner I bought several months ago with a date code of 5A4. The MOD to obtain full 800mhz coverage on oak.oakland.edu does not work on my scanner. I assume because it was manufactured at a later date. So more circuitry was added to block the 800mhz region. Now what I am wondering is if anyone has a Mod that will work on the newer PRO-46 scanners?? Any and all help is greatly appreciated!

please send any mods or info to me.
thanks in advance!

MS> I saw the same ad and I am considering buying that scanner too. Does
MS> anyone kno w if
MS> this scanner can be modified for 800 mHz cellular?

Like almost ALL scanners for sale new now, the answer is no. The TDDRA said
that scanners could not be easily modified to tune the cellular frequencies,
and manufacturers have taken that to mean IMPOSSIBLE. While there have been
a few mistakes (early PRO-51, for example), this rule holds.

861. Scanner newbie help!

Newsgroup: rec.radio.scanner
Date: 1995-07-13 00:00:00 UTC
From: kkanders@moose.uvm.edu
Message-ID: <1995Jul13.005825.11415@emba.uvm.edu>
Source record: 252462

Hello
I'm a scanner newbie and would like some responses to a few
questions. I went to the Rat shack a few days ago to look for a scanner
I kinda poked around on the net looking for info on scanners and such.
I know I want a base unit with the 800 cellular frequencies. At the store
I saw four models that were around 200 bucks. They are as follows:
"2039-200 channel-229$", Pro2026-100 channel-229$, Pro2037-200 channel
199$, and finally the Pro2040-100 channels(price I forgot).
On the net I have seen the mods for the 2026. However I've seen some
posts stating that the "new" 2026s can not be modified. Is this true and
if so how do I determine which 2026 can be modified?? Also I would like
any info on the above models in terms of performance. My dad is a ham
who builds his own wire antennas, so I presume my antenna system will
be up to par. Well if anyone can help me sort the above out I would be
grateful.

Please feel free to e-mail

Thanks again,
Kurt Anderson

If you'd like to have some really long record time, use your VCR and
send the audio (with antennuator cable) into the audio IN. You'll
get up to 8 hours of action for those BIG important events!

KA> @FROM :kkanders@moose.uvm.edu N

KA> Hello
KA> I'm a scanner newbie and would like some responses to a few
KA> questions. I went to the Rat shack a few days ago to look for a scanner
KA> I kinda poked around on the net looking for info on scanners and such.
KA> I know I want a base unit with the 800 cellular frequencies.

In that case, you are out of luck. The models in Radio Shack stores can't be modified for cell freqs, unless you really luck out and find a pre-ban one. Since the ban went into effect in April of '94, you can see how little chance of this there is.

KA> At the
KA> store I saw four models that were around 200 bucks. They are as follows:
KA> "2039-200 channel-229$", Pro2026-100 channel-229$, Pro2037-200 channel
KA> 199$, and finally the Pro2040-100 channels(price I forgot).

The differences in performance between these models boils down to one thing: double vs. triple conversion.
The '2037, being both triple conversion and 33% off list price makes it the best of those you mention. Note also, it has 200 channels for less than others with only 100 channels.

KA> On the net I have seen the mods for the 2026. However I've seen some
KA> posts stating that the "new" 2026s can not be modified. Is this true and
KA> if so how do I determine which 2026 can be modified??

See above. The units capable of being modified are mostly gone from dealer's shelves.

KA> Also I would like
KA> any info on the above models in terms of performance. My dad is a ham
KA> who builds his own wire antennas, so I presume my antenna system will
KA> be up to par.

Despite what many will tell you, the basic differences in performance boils down to this: double or triple conversion. Triple is (MUCH) better. While there are other enhancements that make a difference, without triple conversion, they are like putting an earing on a pig; pretty, but a waste of a good earing.
Once you have triple conversion, then number of memory channels and ergonomics are next, IMO. More memories = better. For a first scanner, that pretty well says it all. The other enhancements will come into play as you mature in the hobby.

It is important for you to understand that what *WE* think of a scanner isn't nearly as important as what *YOU* think of a scanner. It's yours, and you will use it. As a newbie to scanning, you probably don't know what aspect of the hobby will be your focus yet. That's OK, it's normal. There is so much out there (police, fire, FEMA, federal & local gov't, HAMS, sheriff, air [civil, commercial, military], etc), and no way you can cover it all, that you will have to specialize to some extent. That specialization will determine what bells & whistles you will want later. The '2037 should serve as a great basic scanner to start, but, like most of the rest of us, you will experience a desire to upgrade. That's OK, take your time, and learn what *YOU* want. We will always be here to offer help, but remember that its *YOUR* hobby, and our opinions are only that: opinions.
Have fun!

You need to get the service manual from Tandy Nat'l Parts (800-843-7422).
The manual has the schematics and PC Board diagrams to show you what trace
to cut. It's easy with the manual. Without the manual, it's hit-or-miss
trying to describe which trace to cut.

As far as a cell mod is concerned, you are SOL. The '2037 is triple
conversion, so you won't get images, either. The up side is that the '2037
is a better scanner!
Tandy Nat'l Parts (800-843-7422) can supply a service manual. Have your
credit card handy. It has the schematics.
Maybe you could keep an eye out for something like a PRO-2022 or similar
older scanner that will ba able to be modded to receive the cell freqs. They
aren't exactly cheap, though.
You might try haunting local pawn shops and garage sales. At the latter,
people sometimes don't know quite what they have, and sell them really
cheap. You have to do some homework, to know which models can be modded for
cell reception. As a starter, this is a list of modifiable Radio Shack
scanners, as my list goes:
These are all "PRO" models: 2004, -5, -6; 2022; 2027; 2026; 2032; 2030; 34;
37; 39; and SOME (earlier units, as a rule):46, 43, 51.
There are others from Bearcat/Uniden (BC200 is a good one), and probably a
few others as well.
Hope this helps.

LD> Thank you!

The "best" antenna is the one that does what you want it to do.
Do you need an omnidirectional or directional antenna? Will this antenna go on your roof, or will it be attached to a handheld? Are you *allowed* to put an antenna on your roof, or are you looking for a 'stealth' antenna?
While these may sound like stupid questions, they all have a bearing on what's "BEST" for you.
For some, "BEST" merely means most expensive, for bragging rights. ;-)

Message-ID: <3u3qps$1m8m@usenetw1.news.prodigy.com>
Source record: 252469

I own a Uniden SportCat Tiwn Turbo Scanner will this work on it & how?
****I did not write the following text***
****
**
The following is a keypad modification for some Radio Shack scanners and
also some Uniden scanners, that will restore cellular (824-849 MHz and
869-894 MHz) coverage. Even though these scanners say they scan from 800
MHz to 900 MHz or whatever, they DON't scan the frequencies listed above!
Lots of these scanners are cellular blocked at the factory, so they can
charge you more for a 'better' scanner, while manufacturing identical
parts I know it will work on the following: Radio Shack Pro-46, Pro-23,
and Pro-51. I've tried
other Radio Shack scanners, in the store and it worked on all I tried,
that
is until the salesperson questioned me and I had to leave. Therefore, I
don't
remember which ones it also worked on. I have only heard that it works
on
some Uniden models, but I've never tried it, though it should work, as
Uniden
makes lots of Radio Shack scanners.

** REMEMBER, IT IS UNLAWFUL TO MONITOR CELLULAR TELEPHONE
CONVERSATIONS!!!
** THESE PROCEDURES ARE DESCRIBED TO PROVIDE CONTINUOUS FREQUENCY
COVERAGE
ONLY!!
The only problem with this procedure is that it will delete EVERY
frequency
that you have stored in your scanner, so remember to write them down, or
you'll be stuck!

1. Turn OFF your scanner and hold down the 2, 9, and LOCKOUT keys.
2. While holding these keys down, turn it on and wait for just a second,
then
release the keys.
3. Manually step (with the manual key) to channel 23 on the Pro-51 and
Pro-46
or channel 15 on the Pro-23. You will see 888.960 displayed, a
factory
test frequency.
4. Press your scan button, up or down to scan in 30 KHz steps. Store the
frequencies you want, temporarily, by pressing the MONITOR key.
5. To store them permanently, step to the MONITOR channel you want to
store

and press the PROGRAM key, then the desired memory channel that you
want
to store it on.
6. Press in sequence, PROGRAM, MONITOR, ENTER. Repeat these last two
steps
for each channel to be memorized.
****
***
I have also found that on the Pro-46, I can receive 60 MHz to 87 MHz and
others. If you step through the channels when you first turn it on, as
described in steps 1,2, and 3, you'll see all sorts of frequencies that
you
could'nt receive before!

THANKS FOR ANY INFO

870. EL panel lifespan

Newsgroup: rec.radio.scanner
Date: 1995-07-13 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DBnzIL.8BL@ennews.eas.asu.edu>
Source record: 252471

I was wondering what the approximate lifespan is for an electroluminescent panel like the one used in the BC-9000XLT is. Is the lifespan increased by operating it in the "dim" mode? (Obviously, keeping it off increases the lifespan...) Can the EL panel be replaced when it finally does stop working, or would that involve installing a new LCD display? Any info is appreciated.

I built a setup using this method, except I use a HiFi stereo VCR. On one track I record the audio from the scanner; on the other track, I record an audio tone whenever the scanner's squelch opens (requires a squelch tap point be located in the scanner). Then I post-process the videotape by re-recording the audio from the videotape to a regular cassette recorder, using a 567 tone decoder to sense whenever a tone is present on the alternate track and activate the cassette recorder, thus stripping out all of the blank time gaps.

Works great for airshow recording!

: VS>or not? ...and do I connect the ground of the coax to something? Please

All that can be said is that it would be better than a rubber
duckie on the scanner itself; long wire antennas are really only useful
in situations where the physical length of a tuned antenna exceeds
practical mounting setups. It would be much better to construct a dipole
or quarter wave vertical antenna for the lowest freq you intend to pick
up. In addition, it is permissable and often very bennificial to put more
than one set of dipole legs (or driv ele/radial) for another freq, so
long as the freq's are not very close together; I'm not certain of the
minimum difference but a 8-10 Mhz gap is plenty. This type of multiband
setup is a very good performer for scanners since each band (just about)
can have its own set of elements and the others are not even seen by the
freq of interest. Good luck on you setup.

Here's some frequencies for you.

Minneapolis Police South Ch. 1 460.025
Minn. Police North Ch.2 460.100
Minn. Police Northeast Ch. 3 460.175
Minn. Police car to car Ch. 4 460.250
Minn. Police Info. Ch. 7 460.425

MN State Patrol St. Paul 154.935
" " " Golden Valley 155.505

The Minneapolis police freq's will give you all dispatching of their calls in the whole city besides the one's they send over MDT

Those two SP freq's should give you a lot of what you want to here around the Twin Cities.

If you need more, you can E-mail me or post here. My specialty is fire freq's but I know a little police, too

I was told that Amtrack uses whatever frequency belongs to the track they are on. So if they are on a Union Pacific track..they will use their road channel. I did find the conductor on a 457.925 or something like that.

Don't forget about the FRED ..the end of train transmitter device.. it transmits brake presssure etc back to the engine.. and it's around there 457.9375 or close to that.

I have aseveral Bells and a Uniden detectors.
Both will respond to signals from about 8.5GHz to 12+GHz(for X band).
Sensitivity does decrease toward either the high or low end.
Why the interest in those two frequencies?
While I do not have the FCC rules in front of me, it seams that
they are used for point to point voice or data.

Thanks Bill! Right on.

It doesn't matter if they have a leg to stand on or not! Haven't you all
figured that out yet?

Motorola has the BEST LAWYERS MONEY CAN BUY. Period. (just ask Jay Harris)

Civil cases can get really ugly, and I'm sure they can prove (one way or another)
that civil "damage" was done by decoding the trunking data stream to track the calls.

The only way ANY device of this nature will ever be available is on the "grey to black"
market. I sincerely doubt that anyone would be stupid enough to advertise, except
maybe in an electronic forum such as this. I would think that the "module" approach
to the OPTO535 is definately the way to go...Build a "FSK decoder", sell it to read pagers
or ACARS or something stupid like that, but have some 3rd party write the s/w to support
the trunking.

Doug

897. Unauthorized radios on 800 MHz....

Newsgroup: rec.radio.scanner
Date: 1995-07-14 00:00:00 UTC
From: batwing@digital.net
Message-ID: <3u5sfa$n6i@ddi2.digital.net>
Source record: 252200

Removing the finals, or disabling the transmitter via the s/w WILL NOT keep the radio from being put to sleep.

If the sys administrator finds/notices the duped radio, he can kill it, assuming he is using a system capable of such.

You will notice that newer Motorola radios route power to the controller board PRIOR TO THE ON/OFF SWITCH. Do you think there is a reason for this?

You bet! Not only can the radio be "killed" WHILE IT IS TURNED OFF, it can be KEYED UP AS WELL, WITHOUT LIGHTING THE XMIT LED (in other words, you'll never know..) If there is a battery on the radio, the controller board is HOT. If the radio can "hear" the data stream, IT CAN BE TURNED OFF.

Trunking fraud is becoming a real pain in the butt for Motorola and EFJ/Uniden...Not as much a problem with EDACS, there are too few systems out there and the system sucks anyway. This is the reason for the features above, not to thwart scanner owners.

Isn't a radar detector basically a scanner? <--rhetorical, I know the answer and the functional differences.
To get those frequencies if your detector doesn't already (I don't actually know the frequency ranges of different radar bands). Maybe you could take it apart and do some adjustments. I think you can also change the length of the GUNN diode to change the freq. range. Don't recall for sure but I think there was a discussion of this in rec.radio.amateur.homebrew.

You probably don't want the E model, and shouldn't want the D model. The E
model has less coverage than the A (for "A"merica) (E stands for
"E"uropean"), and the D (for "D"eutch, or German) has even less coverage.
Let's see...
The A model covers from 100 KHz to 30 MHz.
I'm not sure what the E model loses...
The D Model covers (approximately) 150 KHz to 26.2 MHz.

As a rule, only the A model was sold here (others could have been brought in
on an individual basis, of course).
A good, solid radio, somewhat dated.

AB> @FROM :KQTE08A@prodigy.com N

AB> How do you operate your 2006 with a battery. Is it hard to make
AB> that possible?

Sure is. On the back, there's a jack for 12 Volt DC in. Any 12 volt battery
able to supply about 500 MA or so will run the scanner.
Most, however, will use a 12 volt converter that plugs into the wall.
You can, of course, run the '2006 off your car's battery; just gett he
proper plug (guess where!!), use a fused line, and you're up and running!
Hope this helps.

906. Wanted: Flex Pager FAQ

Newsgroup: rec.radio.scanner
Date: 1995-07-14 00:00:00 UTC
From: dmathews@netcom.com
Message-ID: <dmathewsDBptFt.219@netcom.com>
Source record: 252209

Several months ago, I found a repost of the POCSAC faq which explained how the system works in detail. Several carriers are coming online with a new low power consumption paging system called Flex. Has anyone seen information on how this system addresses pages?

On another note, several years ago, I used to see an Autocad drawing of the entire radio frequency band and what "products" used each frequency. (Cellular, Police Radar, etc, etc). Has anyone seen a postscript version of this, or even the old Autocad version that has been updated?

Thanks!

Dave

Does anyone know what frequencies and modes are used for public service (police, fire, etc.) transmissions in Germany? We have some relatives from Germany visiting and I'd like to give them a nice scanning toy to bring back home, if something appropriate for their frequencies can be bought here. The last time they visited a number of years ago, scanning there was verboten, but since then the laws have changed. Any info on frequency usage or appropriate scanning units for European use would be greatly appreciated!

-> You cant MN> just use the transformers made for TV since they convert
-> to 75 ohms MN> used by TV coax. Try the library. They will probably
-> have an amateur MN> radio handbook which shoul;d describe how to
-> build a BALUN which is MN> what you would need.

^^

This I agree with. But not REALLY needed. You will still do
better with a mis-matched line, hooked to the T.V antenna, than if you
used the stock antenna that came with the radio. Actually, the
transformers MAY actually help a little due to the fact that after
concversion there would be less of a mis-match than without them.
75 to 50 Ohms, compared to 300 to 50 ohms. The greater the mis-match,
the greater the loss. An antenna PRE-amp really performs miracles. I
recommend it to anyone that is not suffering from intermod. The best
idea would be to put up another antenna, that IS 50 ohms, and in the
process eliminating any need for an impedance matching device that will
cause a slight loss in signal. ANYTHING inserted into the line whether
it be a balun, or even so much as a coax connector will exibit *some*
loss of signal. Best to avoid anything of this type. Especially at
higher freq's.

-> GOOD NEWS! The scanner won't be able to tell the difference between
-> 50 ohms and 75 ohms, so use the standard TV transformer. If working
-> with a transmitter, the difference would make a difference. Since
-> scanners are only receivers, no problem.
-> Bill Funk
-> Internet: bill.funk@iotp.com

^^

This I DO NOT agree with.

Check out the ARRL antenna handbook. Whether the radio is the power
source (transmitting, power going *toward* the antenna.) OR, whether
the antenna is the power source (receiving, power going *toward* the
radio) any difference/change in medium that the signal must transverse,
will cause part of the signal to be REFLECTED BACK toward the source.
In this case, the "change" in medium would be the difference in
impedance across the line. Or, if the antenna was 75 ohm, and the line
was 75 ohm, the change would be at the input at the radio. Which in all
probability is 50-52 ohm. An easy way to picture this....
Ever went swimming? Can't hear noises coming from under the water?
Stick your head under the water? Now what do you hear? Can't hear a
train coming? Put your ear to the tracks? Now can you hear it?

Remember the indians? They would put their ear to the ground so they could hear the horses coming. Why? Because that was the only way they COULD hear it. In order for the sound to reach them, it would have to transverse through a different medium. The sound travelled through the ground fine. But not through the air. Again, a change in medium. In both cases the sound/energy/wave/signal, whatever you want to call it, is a lot weaker when it must transverse through/into a different medium, most or all of the energy "stays" in the original medium it started in. One question that comes to mind: Why is it possbile to hear the train/horses/etc through certain types of mediums, and not through the air? Because under normal circumstances, the air is a piss-poor conductor of most types of energy. Where the ground/train-tracks/water is much better.

Johnny

I apologize if I am not very clear on this. Due to the limitations of email, it was the best I could do to get my point across. If anyone wants to debate my energy/medium theory, fine. Intelligent conversations welcome. Flames will simply be ignored.

The audio level would be low but it is possible to demod AM on an "FM"
receiver. It would probably sound better if you were able to narrow the IF
stages of the receiver.

It is not that uncommon for air traffic (AM) images to be heard on ordinary
FM receivers. Our admin assistant mentioned it just yesterday - she heard
aircraft calling Livermore tower on her walkman while she was sitting by her
pool.

Ken, While laws (and courts) differ from region to region, there is a
general consensus that for the most part, public agencies must disclose
what they have done or intend to do. There are clear exceptions though,
to these requirements for Public Safety agencies as they relate to many
"Crime-related" and "Personnel" matters.

It is important to note: "have done or intend to do". There is no clearly
defined requirement (in most circumstances) for a Public Safety agency to
disclose what it is doing, WHILE IT IS DOING IT.

I encourage monitoring enthusiasts to share my view of our hobby as a
priveledge. I am personally not aware of any case law that has
established off-the air monitoring of all communications as a "right"
(press or public).

FYI: Our agency has enjoyed decades of support from monitoring
enthusiasts and the media alike. We are the only Public Safety agency
that I am aware of that has posted its official frequency list on the
Internet. We have purposely maintained a non-trunked fully analog voice
system in the 800 MHz band for this purpose.

It's true.

The PRO-2037 uses the same intermediate frequencies as the
portable PRO-62.

Even though the PRO-2037 uses up conversion, it has images.
Due to the high first IF, the image frequency is pretty far
away from the original signal, but still produced unwanted
interference in the PRO-2037 I tested.

For more info, see the PRO-2037 review in July 1995 Monitoring Times.

925. Building My Own Transmitter

Newsgroup: rec.radio.scanner
Date: 1995-07-14 00:00:00 UTC
From: dorian@coho.halcyon.com
Message-ID: <3u55hc$9bj@news1.halcyon.com>
Source record: 252228

This is to anyone who knows a little about radio construction. I wanted to play around with some low wattage (.5 -> 2 watts approximatly). I would like to build my own, or build from a kit a transmitter, but how hard is it to change the transmission frequencies? Specifically I'd like to transmit in the 30s to upper 40s Mhz frequencies. Does altering a transmitter's frequencies require alot of deviation from the original schematics?

The other question is does anyone have any good suggestions for basic radio electronics books? I am somewhat of a beginner, and would like a book to start out in. Thank you...

>Radio Shack).

I had the same problem with a PRO-2004 and a PRO-43 and a ham radio HT.
My solution was to put an inductance-capacitance filter in line with the
power to the radio - I used a filament transformer secondary for the
choke coil, and a large (over 1000uf) capacitor to ground. One thing I
did do later on was to put the normally closed contacts of a relay in
line, with the coil wired to the starter so the radios were off while
the engine was cranking. The filter did the trick for me, the relay was
just a un-necessary extra.

>On the west coast, I would check out Santa Fe, Southern Pacific and
>Union Pacific and Burlington Northern just for starters.

For what it's worth, I rode Amtwack from L.A. to Portland, OR and back
earlier this year, and they used 161.55 at both ends, and 160.315 in the
middle. I forget where the changeover points were.

One of the conductors was nice enough to key his radio a few times so my
Pro-43 could spot the frequencies in search mode. Some will, some won't.

Bc> the cellular bands. The early CPU was based on the older, smaller
Bc> cellular bands of 825-845 and 870-890 MHz. The newer CPU gives 30 KHz
Bc> steps between 868.95 - 894.0 and 843.95 - 869.0 MHz, and is completely
Bc> interchangeable with the old one. I know.............

Cr*p! When did that happen? Oh, well...guess I will have to live with
the old CPU. <sigh>

> The 2006 uses a completely different CPU. The 2006 CPU would not be
>compatiable with the 2004.

Bc> THAT is not a foregone conclusion. True, the 2004 CPU is a 64-pin DIP
Bc> style while the 2006 CPU is a 72-pin surface mount type. At first
Bc> glance, there seems no relationship. But.....if one were to hold the
Bc> data sheets for these two CPUs side by side, PRO-2004 Service Manual,
Bc> pages 67-68 and PRO-2006 Service Manual, pages 71-72, it can clearly
Bc> be seen the following interesting information:

Bc> 1. PRO-2004 CPU has 62 active pins/functions
Bc> 2. PRO-2006 CPU has 62 active pins/functions
Bc> 3. The active pins of each CPU can be correlated to have the exact
Bc> same functions! Ohhh yessss, baby!

I just checked. Verryy Interessttingg! <g>

Bc> Therefore....if a PRO-2006 CPU is laid out on some sort of a header
Bc> atop a 64-pin DIP socket and if care is made to match up pin function
Bc> for pin function, it is probable that it would work. The 2004

No doubt about it...

Bc> resonator should be exchanged with one for a 2006, of course, but that
Bc> is about the extent of the needed work.......which remains easier said
Bc> than done, by virtue of the necessary micro-wiring of the header.....

Granted...but an experienced tech should have no problem with the wiring.

Bc> However, the gentleman to whom you replied does not necessarily have a
Bc> blown CPU. Early PRO-2004's were susceptible to defective solder
Bc> joints at random on their PC board, caused by an out-of-tolerance wave

Bc> soldering machine at the factory. If he did not mess around inside
Bc> the unit to speak of, I might suspect solder joints before brain
Bc> death.

Had heard something about that on CompuServe several years ago.
Thankfully, the 2004 has given me faithful service since I picked it up in
'87. (too bad the EL is for cr*p.)

While we are on the topic of 2004, I got a message from someone on CI$
that you no longer recommend the squelch mod and that you changed your
scanners back to factory condition in this circuit. Is this accurate? Is
the factory method the recommended?

Thanks...Jerry

character in the right margin.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly |

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 | and PRO-60 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high

frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for | "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner | to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to | mean a change which permits a scanner to receive cellular | phone frequencies. This definition is far too restrictive | as there are several ways one could modify a scanner, e.g., | changes to improve audio quality, adding an S-meter, |

expanding the number of channels, changing the earphone | jack to accept stereo headphones, etc. |

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us |

If you cannot find files describing modifications to a | particular scanner, it's probably because nobody bothered | to devise a modification, or more likely, nobody has taken | the time to document their modification. |

Modification articles posted on Usenet seem to have a life | of their own. Frequently, they are plagiarized from the | Internet and compiled by book, CDROM, and magazine | publishers, sometimes reworded, then sold. Hobbyists then | copy the modifications from the books, CDROMs, and | magazines back onto the Internet or BBSs (bulletin board | systems)! |

Grove Enterprises and other companies advertise a | modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at

9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The

space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your

office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an

unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern

states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All
meetings will be held on Saturdays at locations announced
in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave.
August 19
October 14
December 16

Bring a notebook.

I am interested in buying a scanner. 100 channels. I want to be able to get police and Highway Patrol, among other things. I only want to spend about $100. I would like it to be a fairly new model. If there is anyone who has one for sale, please E-Mail me right away because I want to buy one for my birthday, which is coming up soon.
THANKS

937. Need VA Pager Frequencies

>it's laughable.

Do it. Do something that counts, Moss. Carve something into the
granite cliffs of Life......do something that leaves me in the dust.
do something that will inspire you to cut loose with a primal scream.

Do something to win..... anything. But just do it.

>this far this is a very long story but Mr. Bill Cheek
>not only threw the first punch he has ignored peace-offerings and has
>done everything in his power(which isn't much) to gag me.

If I had a dog as stupid as you, I'd have him de-brained and cottage
cheese packed into his skull cavity.

You cannot accuse me of throwing the first punch anywhere, and most
notably HERE where you've posted lie after innuendo after bullshit
before I ever responded. It is a matter of record. It is not
arguable. Your lack of candor is now prima facie. The only question
is which is the greater? Your lack of candor or your excess of
imbecilic idiocy and utter nincompoopery?

>Total nonsense. Envy? Sounds like that Cheek ego happening again.
>I am not envious of you at all, Cheek. Cheek, in case you have not
>noticed, I am absolutely NOTHING like you and I have no desire to be
>anything like you. You don't have ANYTHING I want nor will you ever!

Then that is good. So why do you keep coming to me, then? You don't
seem able to ever leave well enough alone. I must have something you
want. You must feel it incumbent on you to ride herd over me so you
can demonstrate your prowess and great skills. You must be puke-green
with screaming, teeth-clenching, tear-jerking envy. A psychiatist
friend of mine says you are, anyway. That's how he evaluates your
messages.

>And the list is growing Cheek! Folks don't need me to prove to them
>that you are a complete two-faced asshole. Nobody needed to point it out
>to me initially. You do a great job on your very own!

So why do you keep coming on to me? I must have something you want.

>: Oh.....and I rather enjoy a good peeing contest now and again.

>Sure, as long as you win you enjoy it. You haven't won this time nor
>are you going to.

Watch.

>: Bill Cheek
>: Nobody....

>I totally agree!

Ok, now who are you?

>BTW, your rebuttal to my Log Periodic reply is totally bogus, dude!

No. You're just ill-trained and steeped with a lot of horsefeathers
from your CB activities.

>Do yourself a favor and check out how a TV masthead antenna is made and
>you'll see why I am right and you are completely wrong. The point which
>I made, you missed and others understood, was that the VHF TV antenna is
>actually two log periodic antennas on one boom. One is engineered for the VHF low
>band and the other the VHF Hi-band.

Snicker. Giggle. Chuckle. Do you really think THAT? Ha ha ha ha
You're farther from touch with reality and technology than I thought.
I heard you were a janitor with a high tech company. One would think
you'd be smarter than that.

>You know, the frequencies that 99% of people with scanners never listen too.

Ready for a lesson, Mossy-Baby? Get your paper, pencil, and
calculator. There will be a pop quiz later.

1. TV antennas for the USA (may be different in Canada) are expressly
designed as follows:

54 - 88 MHz
88 - 108 MHz
174 - 216 MHz
470 - 890 MHz

2. In order to get specified performance at the band edges, the
antenna will be "overdesigned", meaning that positive gain will
be apparent well outside the bands of design.

3. Now let's look at the gaps in the above spectrum which include
scanner frequencies:

25 - 54 MHz
108 - 174 MHz
216 - 470 MHz
890 - 1300 MHz

Understanding that a wideband antenna will still perform with high
gain and other specs within 1-octave of its design passband, it can be
readily seen that all of the above gaps are well within one octave of
the passbands. For instance....one-half an octave up from 216 MHz
places an edge at 324 MHz. One-half an octave down from 470 MHz
places a cutoff at 352 MHz. (I'm using half-octaves to be
conservative even though full octaves are valid).

Therefore, even in the gap of 216-470 MHz, there is ample overlap
coverage from the passbands of 174-216 and 470-890 MHz.

The simple conclusion which can be empirically demonstrated with
minimal effort is that a TV antenna will perform well above a discone
at 343 MHz, a point halfway in the gap of 216-470 MHz. It doesn't
matter that performane will be slightly down from the TV band specs,
because GAIN, F/B ratio, and side-lobes will still make the antenna a
superior performer to discones, dipoles, and even narrow band yagis,
and for that matter, the Create Log Periodics which have low gain for
their wide bandwidth....typically 6-8 dB.

A TV antenna will be competitive with the Create Log Periodics even in the gaps of its performance.....and as a PLUS, will cost a LOT LESS than the Create antennas.

>the last time I checked silver connectors were not only cheaper than gold
>but they had lower resistance and are more popular on antenna connections
>anyway.

You are one dumb doode, Mossy-Boy. Silver easily corrodes and the oxide layer is a good insulator. Gold does not corrode. The reliability of gold in electronics over silver has been long established and is a given. It is not arguable. Furthermore, you cannot walk into Radio Shack or other consumer electronics stores and buy silver plated connectors. Gold plated connectors are readily available to even the casual hobbyist, and at affordable prices..

>And considering that I don't even consider myself an antenna man, I'm
>amazed that you would have the audacity to try and redeem yourself after
>uttering such el crapola.

You are going to be an antenna man before I get done with you. Ready for your Pop Quiz now?

941. TV Antennas For Scanners

Newsgroup: rec.radio.scanner
Date: 1995-07-14 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <DBpuCL.9F1@crash.cts.com>
Source record: 252420

(c) 1995 By Bill Cheek, COMMtronics Engineering <All rights reserved>

There is some controversy over the use of TV directional antennas for scanners and scanning. This article lays out the facts and the substance of the issue so folks can see, calculate, and decide for themselves.

So why would you choose a TV antenna for your scanning post? To hear all there is to hear, for one thing. The GAIN of the antenna alone will enable you to hear far beyond your present range with an omni antenna. But there's more! Big city environments are RF garbage dumps, right? Noise and interference wreak havoc and consternation on all but the best scanners, and sometimes even them, too.

Say there is a nearby repeater or pager transmitter that overloads your scanner's front end. The expensive fix is to buy a notch filter or a tunable filter and notch out the offending signal. Often it doesn't work. A TV antenna will work! Sure! Just rotate the antenna until one of its side or back nulls is pointed at the offender, and the results can be startling! Oftentimes, the offender will disappear into the noise, even if you're tuned to the sucker! When the offender is nulled out, the antenna will still receive signals from the forward and other directions.

A TV antenna has many peak and null lobes around its 360-degrees of view. The deepest nulls will be on the back while the highest peaks of gain will be off the front. Nevertheless, there are a whole slew of minor peaks and nulls on each side of the antenna between front and back, and these can be used to great advantage when selecting a desired signal and rejecting one or more undesired ones. The list goes on, but time and space force me to move on. You get the idea?

If you choose to use a directional TV antenna for scanning, it will work wonderfully well between about 30 MHz and 1 GHz and equal to or better than a discone down to 25 MHz and up to 1.3 GHz. The caveat here is HOW to install it......not the same as for TV reception.

A TV directional antenna used for scanners and scanning should be mounted in the VERTICAL plane....that is, with its elements pointing into the ground and into the sky with the boom retained in the horizntal plane as for TV reception. A short mast should be rigged into the normal mount of the antenna....say 2-ft to 3-ft, max. This side mast must mechanically join the real mast that rises vertically from the rotator. Any number of methods of making this a rigid, lasting mount can be employed and will not be presented here.

A TV matching transformer (300 ::75 ohm balun) should be fitted to the antenna as is customary for coax feeds. Then use RG-6 satellite cable from the other end of the matching transformer down to the scanner. Use gold plated Type F connectors on each end of the coax. Down at the scanner, use a gold plated Type F-to-BNC adapter to mate the coax to the scanner. Voila! A low cost, high performance directional beam antenna for your scanning post. Now here is why the sucker works:

Consider:

TV antennas for the USA are expressly designed as follows:

54 - 88 MHz Ch-2 - Ch-6 (34 MHz Passband)
88 - 108 MHz FM Broadcast (20 MHz Passband)
(Good for about 30 MHz to 158 MHz)

174 - 216 MHz Ch-7 - Ch-13 (42 MHz passband)
(Good for about 130 MHz to 324 MHz)

470 - 890 MHz Ch-14 - Ch-83 (420 MHz Passband)
(Good for about 352 to 1.3 GHz)

In order to get specified performance at the band edges, the antenna has to be "overdesigned" by the mfgr, meaning that positive gain and useful F/B ratio will be apparent well outside the bands of design.....i.e., the TV bands.

Now let's look at the gaps in the above spectrum which include desired scanner frequencies:

25 - 54 MHz (29 MHz gap)
108 - 174 MHz (66 MHz gap)
216 - 470 MHz (254 MHz gap)
890 - 1300 MHz (410 MHz gap)

Understanding that a wideband antenna will still perform with high gain and other specs within 1-octave of its design passband, it can be readily seen that all of the above gaps are well within one octave of the passbands. For instance....one-half an octave up from 216 MHz places an edge at 324 MHz. One-half an octave down from 470 MHz places a cutoff at 352 MHz. (I'm using half-octaves to be conservative even though full octaves are valid).

Therefore, even in the widest gap of 216-470 MHz, there is ample overlap coverage from the passbands of 174-216 and 470-890 MHz. The worst coverage in the spectrum will be between 324-343 MHz, but even there, it will be far superior to that of a discone or any other omni scanner antenna!

The simple conclusion, which can be empirically demonstrated with minimal effort, is that a TV antenna will perform well above a discone at 343 MHz, a point halfway in the gap of 216-470 MHz. It doesn't matter that performance will be slightly down from the TV band specs, because GAIN, F/B ratio, and side-lobes will still make the antenna a superior performer to discones, dipoles, and even narrow band yagis,

and for that matter, the Create Log Periodics which have low gain for their wide bandwidth....typically 6-8 dB.

A TV antenna will be competitive with the Create Log Periodics even in the gaps of its performance.....and as a PLUS, will cost a LOT LESS than the Create antennas. More of a PLUS is that TV antennas are easier to install and maintain than the larger, high profile log periodics. Finally, neighbors are less likely to bitch, whine, complain, and turn you in to some nasty authority when all you have on the roof is an innocuous TV antenna, even if it is mounted "all wrong". Neighbors will just think you are stupid and leave you the hell alone.....which is what you want, right?

<snip>

I don't have the UHF freq's handy, but here are channels 2-13
for TV audio (in MHz):

2 - 59.750 8 - 185.750
3 - 65.750 9 - 191.750
4 - 71.750 10- 197.750
5 - 81.750 11- 203.750
6 - 87.750 12- 209.750
7 - 179.750 13- 215.750

We heard a loud boom around 11pm a few nights ago. I took it for fireworks
left over from the 4th of July, but it was very loud. Could easily have
been a sonic boom. Northern Virginia, about 20 miles west of DC.

945. Cellular coverage question.

Newsgroup: rec.radio.scanner
Date: 1995-07-14 00:00:00 UTC
From: s001jap@discover.wright.edu
Message-ID: <3u65d3$s66@alpha.wright.edu>
Source record: 252424

I have a pro-46 that is capable of receiving the base cellular frequencies (about 869 to 896). My question is, what am I missing by not having full cellular coverage? What exactly are the hand held frequencies? (I mean in terms of what devices transmit on those frequencies--the cell phones themselves?). As I understand it, the cell phones do not transmit very far so maybe I am not missing much at all. Forgive my ignorance and thanks in advance to anyone who replies.

Check alt.radio.pirate and look for posts or information from Stephen
Dunipher. He sells transmitter kits up to 5 watts out in the FM band
but they can easily be modified for lower (the non-PLL kits, that is).

No, I'm not advocating radio piracy, Newt Gingritch (or whatever the
spelling) is. 'Get rid of the FCC and sell any frequency to the highest
bidder' says he. Talk about clueless.

>Any one know the "AUDIO" frequency for the TV channel's
> ^^^^^ ^^ ^^^^^^^^^
>Channel 2,4,5,7, etc. etc.

It's 4.5 MHz up from the video. Lot's of help right?
OK, here's a few for example. All freq. are in MHz.

Channel	Freq range	Video	Audio
2	54 - 60	55.25	59.75
3	60 - 66	61.25	65.75
4	66 - 72	67.25	71.75
5	76 - 82	77.25	81.75
6	82 - 88	83.25	87.75
7	174 - 180	175.25	179.75

And so on. The audio on TV is wide-band FM, you'll hear it on a
regular narrow-band FM scanner, but it wont sound as good as a scanner
with a wide-band FM switch on it. Good luck.

> ... who I should I contact in getting schematics ...

Call Tandy National Parts, (800) 442-2425
(817) 870-5600 (from outside the US)

Give them the catalog number of the radio (20-144) and ask for the Service Manual. They cost approx. $6-8. Natl Parts takes plastic, ships immediately, and is the best run division in Radio Shack (damning with faint praise <g>). Your local store could call the same office, but they may charge a markup and will probably botch the order.

I am going to be visiting Colorado during the current shuttle
mission (STS-70) and would like to know of any frequencies
that are NOT short wave that I might hear the shuttle
transmissions rebroadcast on.
The areas I will be in are Ft. Collins, Denver, Colorado Springs
and all points in between (along I25 that is).
Any help would be greatly appreciated.

Usually the 145.46 and 147.225 rebroadcast Nasa Select.
The 5.46 is in Boulder and the 7.225 is in Denver, you'll
probably catch the 5.46 most of the way from Cheyenne through
Denver and beyond I am sure.

I used to live in the Washington DC area and the Goddard Space Center
in Greenbelt, MD used to relay all shuttle communications via a frequency
very similar to the one listed. I've lost all my documentation from
that timeframe, so I can't swear it is the exact same frequency, but
it was a service of the amateur radio club at Goddard Space Center.
This may have caught on elsewhere also. It was great to be able to tune
in whenever you wanted and actually hear everything that was happening!

I think in a big system the chance of finding an outlaw portable is slim. Here in my city recently a few people had obtained the software to program portables on the big public safety group (state police, parole dept, U.S marshalls, Violent fugitive task force, ect...) It is a motorola system. They were found out after the system cordinator was visiting a local traffic reporting company and noticed a portable reciving the state police groups. Within 24 hours under threats of legal action by Motorola in regards to stealing software and having Motorola intellectual property the 6 outstanding portables were voluntaraly turned in to be de-programed and then returned. At no time were the portables found by anyone monitering the system till seen by mistake by the wrong person.

FYI the portables were all owned by public safety radio enthusiasts and traffic reporter media types frustrated by the new radio system.

Recently in my area the largest public safety 800 system found out about 6 portables programed bootleg on their system. The portables were rounded up and de-programed voluntarily under the threat of legal action by Motorola (not the police agencies involved). Motorola cited intellectual property violations and seemed serious enough about persuing it that all radios were de-programed and returned. Pehaps they would have gone to court anyways but all individuals involved worked for public safety agencies and a traffic reporting company. (bad PR to take cops to court for listening to other cops)

If you don't have WFM but do have AM try AM, it's not as good as WFM
but it will be more understandable than NFM.

In the USA, both AM and NBFM modes are used by federal government
stations in 138 - 144 MHz range. A scanner which does not
permit user selection of modes will limit listening here, and there
lies the motivation to modify inflexible scanners by adding a mode
selection switch.

As Bob Zeman does, I search the 138 - 144 MHz range in 25 kHz steps,
AM mode, listening for military air-to-air combat practice.
Military bases in northern Illinois use NBFM communications in the
same range for on-base communications, e.g., fire, security, etc.

PS - Although I've seen the BC200XLT modification published,
I don't think I have a copy on line.

I am in search of the mod for the Pro 2004\2006 backlight dimmer switch. As I understand it the mod changes the switch on the front panel from a on\dimmer position to a on\off position. This would in effect allow the user to shut off the backlight display. The newer Pro 2006's I believe are this way ? Any help would be appreciated.

Please respond via email address below or if necessary post. Thanks...

Kevin Fisher email: kfisher@freenet.edmonton.ab.ca

The New York City Police have more important things to do than track down scanner listeners. If you were stopped you would simply tell them the truth and that would probably be the end of the story. If you were engaged in other criminal activity while you were in possession of a scanner radio that would be cause for suspicion, but otherwise I wouldn't worry about it.

A friend and I brought my R7000 to work (a suburban Chicago Police Department) and connected it to our high gain VHF police channel antenna. We spent several hours listening to Iowa, Nebraska, Minnesota, Missouri, Michigan, Indiana, Ohio, Kentucky, and of course Illinois on VHF High Band! We were hearing mobiles in Marinette WI., almost 350 miles north of us!

While conditions were up that night, this was still exceptional. I know what antenna I want!

I recently purchased a Bearcat 101 scanner at a swapmeet. It has 16 programmable scan positions with an LED and a switch for each position. As it scans the LED above each position lights.

I am seeking a manual for the 101, or at least would like to hear from someone that can tell me how to program it. It has only two switches for programming, labelled 'Ready' and 'Enter', so it can't be too overwhelming.

If you have a manual and would be willing to sell it to me or send me a copy (I'll reimburse for copying/postage) please send email directly.

Thanks,
Perry Locke

> Bottom line, I now use the TV rig almost exclusively.

Was there ever any doubt? Good going! And now you
also have some control over offending or undesired
signals, too! That is almost as important as digging
out those weak ones from 100-mi away.

The thing you need now to quantify the differences is
an S-Meter for the PRO-2006....a fairly easy thing to do.
You game to try it?

I too,have a Pro 46 and you aren't missing much if you follow this procedure. Keep in mind,even if you were capable of programming in every channel you are only going to receive those channels in the nearest cell sites.What I did was, scan between 870mhz - 890mhz and write down all the ones you can pickup(not every channel in a cell site will be active at the time of scanning),get a list(I believe it's called Cellplan,available on the net) of all the channels and there cells.You will now see a pattern of cells that you can pickup.Program the remainder of those channels(there are 15 channels per cell,but channel 1 or 16 is a data channel)in each cell you was able to pickup.
Picture it like this,your location is the center cell and you can receive six cell sites around you for a total of 7 cell sites. 7 cells x 14 channels=98 channels with two to spare on your pro 46.
0 0 0 0 0 0
0 0 * * 0 0 0
0 * * * 0 0
0 0 * * 0 0 0
0 0 0 0 0 0
Now, you might only get 5 or 6 cells,depending on where you are in a cell.But thats okay because you now have more free channels for other things \8D

So the modification documents that are everywhere do not work for models made after April 1994? What is the difference between the ones that were made pre-April 1994? I see models in the stores that have documents dated October '94 and January '95. There's also posts in this group within the last couple of days that tell you how to do modifications. Any clarification would be appreciated.

Generally speaking, and there are exceptions, the cell sites (bases)
transmit on the band you mentioned above, actually 868.950 - 894.000
MHz. Mobiles transmit exactly 45 MHz lower. If your scanner cannot
tune 823.950-849.000 MHz, there is probably little or no loss. In
most cases, the full duplex channel is transmitted by the bases, while
simplex is uplinked from the mobiles. I have heard of reverse cases,
though, but I don't havce an explanation for it.

Yes, that is almost a certainty. You're likely to get the Owner's
manual instead, or at least a barrage of questions on why do you want
a Service Manual, and would you like a battery to go with it, and
would you be interested in a new computer while you're at it.......

AM> book to start out in. Thank you...

Aaron, it sure sounds like you not only want to build a transmitter, but you
want to understand the basics of transmitter design.
We can't teach this is a medium such as this.
You need to learn this for yourself. There are any number of ways to do
this; a mail course, a local school/college, or self-taught. There are many
books in any library/book store that will help you get started.
I'm not trying to rain on your parade. When you ask about altering a
schematic to alter frequencies, you need to know WHY changing a part changes
the frequency. To know that, you need to know the basics of eletronic theory
& practice. Otherwise, you could change, say, one capacitor to alter the
frequency, and not realize the other changes that one change would make, and
scew up your neighborhood's TV reception. And, you don't want that!
Good Luck!

You need a "Great Circle" program of which there are many out and around, and they are more accurate than your spec. I have several on my BBS somewhere, I think.

I also developed a spreadsheet model and published it in my recent ULTIMATE SCANNER book as well as in a recent back issue of Monitoring Times Magazine. This model is available from my BBS as an EXCEL 5.0 sheet and as a MS WORKS 3.0 sheet. An ASCII text file is also included for easy importation into other spreadsheets that do not recognize Excel or Works spreadsheets.

Pick your poison. There are lots from which to choose.

Was there ever any doubt? Good going! And now you also have some control over offending or undesired signals, too! That is almost as important as digging out those weak ones from 100-mi away.

The thing you need now to quantify the differences is an S-Meter for the PRO-2006....a fairly easy thing to do. You game to try it?

-+* MUCH STUFF ABOUT INDIANS & RAILROADS CUT *+-

I have the book, have read the book, and understand most of it.
The difference between an inpedence of 75 ohms & 50 ohms has nothing to do
with railroad tracks, or changes in media.
The signal is traveling through wire, at either impedence; there is no
difference in the transmitting media.
For receivers, that small mismatch is not significant.
Don't take my word for it. Get a few scanner magazines, and read them.
Experts will say the same thing.

>I would prefer to scan all 40 channels.....

The Electra/Bearcat BC20/20, also seen as the Heath GR740, was the
successor to the BC220. Externally, the only real difference is the
extra twenty channels.

Internally, the feature board is quite different. The older BC220
used a 1024 x 1 serial RAM memory chip and a special "COPS" memory
controller chip. There were 2 custom CPU-type chips, too.

The BC20/20 used a single CPU and the memory IC had 8 address
and 8 data leads. One of the address leads (A7) is connected to
the A/B memory bank switch you want to eliminate.

While I don't have a ready-made modification to eliminate
the switch, I envision the output of a simple flip flop connected
to RAM pin A7 and triggered by a yet-to-be determined signal.

Here's my idea for a bonus modification to double the number of
channels from 40 to 80: Electra squandered 1/2 the capacity
of the RAM by connecting 4 pairs of data leads together. Just break
the 4 connections and bank switch the bus between the 4 pairs of
data leads instead (e.g., 4 pole, double throw switch).

Hi all.

I've been looking around for a piece of equipment that will decode CTCSS/DTMF tones in real time for the Pro-2006. Does the Universal M-400 do this? If not, could a product or products which do do this be suggested?

For those readers in Ontario, I would very much like to stop the CTCSS tone that the OPP uses so I can actually listen to them!

Also, does anyone have any comments on the Micro-Mag MM3B scanner antenna? I just picked one up and I'm wondering about other scannists experience with it.

Any help on either of the above would be most welcome.

Cheers,

Jesse

Hi All,

I have a Sony Air-8 scanner ...

Pauses and waits patiently for y'all to stop laughing ...

Pauses and waits some more :)

All done ? Good, what I'd like to know is, does anybody else out
there use one ? And are there any mods for increasing coverage ?
It's pretty good for Air and 144-174Mhz but would like to get
a bit more if poss.
Please don't suggest trade-in 'cos I'm broke :(

Thanks all

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel

(e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542

Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist

called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to

determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their

transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

>Any help would be appreciated.

Don't they use the standard air bands (108-136 civilian, 225-406
military)? Also,
if you're talking about metro traffic helicopters, you might wanna' seek
out the
frequencies that they use to beam traffic reports to the radio/TV
stations. Those
would be in one of the mobile broadcast bands. If paramedic helicopters
are your
thing, try the civilian air spectrum and also monitor the MED frequencies
for ground
support if they're used in your area.

1028. LOOK > PRO 2004 DISPLAY MOD

Newsgroup: rec.radio.scanner

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Anyone interested in a mod to transform the Pro 2004 display into a scanner with a display like the newer models Pro 2006. This mod will change the scanner display dimmer from a on\dimmer to a on\off as in the Pro 2006.

It is very simple : CLIP THE RESISTOR : R702 (100 Ohm) . This is it !!

It is located very close to the switch itself on the display board itself.

This mod will eliminate any concerns about fading displays (Although mine hasn't displayed any problems after 8 Years of use)

Yes..I also live in the New York city area and always monitor the NYPD citywide and NYPD helicopter freq 123.1, when the Pres id due to arrive in New York. You will hear the SS freqs become very active prior to his arrival, but once its wheels down, they go scrambled. Where ever the Pres goes, the local county and state police agencies provide law enforcement support with the SS. Enjoy the listening !!!!!!!!!

Amen!!!!!
I got a realistic pro-25 for $139. Works great, no manual but I can
figure it out without.
I got a DX390 for $80. Works great, I love it!
I also got a s sony ICF2002 for $32! This was thee find for me! Great
radio and very portable!
Cd's are usually cheap there too!
Hmmmm..... Perhaps I should not talk so loud about these great deals
otherwise they will all be gone before I get there! :)

My D/FW freq list must be outdated. I was in Ft. Worth the other day and while scanning the FWPD freqs I came up with the Dallas PD freqs!! Imagine my dismay when I was hearing busts on Harry Hines and traffic accidents on LBJ while sitting 100 yards away from the Ft Worth/Tarrant County jail!

I've tried massive searches of the web and gopher and I cannot find a good list. Does anyone have a list? Anyone have a starting point for me? Any help would be appreciated. I want to use some samples in the background of a student film. Thanks!

: this scanner can be modified for 800 mHz cellular?

No, it cannot. Nor are any future scanner models likely to be modifiable.
The control is in firmware burned into the CPU. That firmware cannot be
changed.

Of course, you can always buy or make a down-converter.

I had this sold; the guy disappeared on me...

Selling for Dan, N3UBM:

Icom IC-R1, handheld shortwave/scanner, covers AM/NFM, WFM, continuous coverage from 100 kHz to 1300 MHz. Good/very good condition, with a couple of small scrapes and the lettering on the bottom row of keys somewhat worn. Works great, and is VERY small (9.9 ounces).

Internal battery (don't know capacity), other batteries optional (takes BP-84/BP-85 series). Comes with AC adapter/battery charger, aftermarker rubber duckie antenna, and manual with cheat sheet.

Whereabouts of belt clip and hand strap still unknown.

Asking $350/offer. No flames, please, I'm selling for a friend. Email or call. Thanx!

Perry:
I have a Realistic PRO-12 4ch mobile scanner(probably an earlier version of yours), and I can still get crystals for mine from Radio Shack. It will probably cost you about $5.00 per crystal, and the store will have to order them, which takes about a week. By the way, my PRO-12 was manufactured in 1974, so yours might have been made a few years after that. To find out for sure, check for a sticker with a date code like this "5A4", etc. Since you know the scanner was made in the '70's, the "5" would mean May, and the "4" would be the year, in this case 1974. "5A6" would be May, 1976, 12A4 would december 1974 etc.

Hope this helps,
Craig

Message-ID: <3uar75$mft@odo.PEAK.ORG>
Source record: 252364

Bill Cheek (bcheek@cts.com) wrote:

: There's the rub now, because all other scanners use a CPU that also
: houses the LCD Display Driver....all on a single chip. There is no
: serial data path to intercept for that data acquisition mode. No
: problem with controlling the scanner remotely, including
: AutoProgramming from an ASCII text file, but it is not possible to
: acquire display data to send back to the PC for logging and further
: processing.

: Thus, the CE-232 is capable of "full 2-way" control and data
: acquisition with the PRO-2004/5/6 and only 1-way control with all
: other scanners. Only the PRO-2004/5/6 have an accessible serial data
: path together with the requisite clock (SC), command-data (CD), and
: chip select (CS) functions that it takes for data acquisition to be
: possible by that means. Other scanners can only be programmed and
: controlled by the PC but no data acquisition.

Why can't you just pick up the parallel data sent to the display? Such information as frequency and mode are available. Granted, it would be a bit of work to get the timing right, but that is also available. It has to be, or the displays would not work.

Bill

The freq:418.500 is a non specific US Gov.frequency. Considering the amount
of federal agencies, particularly federal law enforcement agencies in the
state. I would keep that on in memory untill I was sure it wasn't. It could
provide some good intercepts.....raydo@traveller.com

1049. MAKE $100,000. IT REALLY WORKS!!!!

Newsgroup: rec.radio.scanner
Date: 1995-07-16 00:00:00 UTC
From: Homer
Message-ID: <3ubh9j$du4@vodka.intele.net>
Source record: 252371

Subject: AN EASY WAY TO MAKE $100,000 IN 30DAYS OR LESS, LEGALLY!

$$$ FOR YOUR RECIPES $$$

Please do NOT change anything contained in this letter EXCEPT as
directed!

EARN AS MUCH AS $100,000.00 OR MORE IN 30 DAYS, LEGALLY!

EARN MORE THAN EXTRA MONEY!!
YOU WILL BECOME FINANCIALLY INDEPENDENT!!

Here's how to do it.
IT WORKS EVERY TIME! Again don't change anything.

Follow these instructions exactly and you could make $100,000
in the next 30 days. This program REALLY works. It makes money
for those who do it honestly! Take the time to read it COMPLETELY!

I know, ordinarily, we disregard these letters because they usually
don't
work like they're supposed to, but this ONE is DIFFERENT!

Carl Simmonds used this legal program last year and made $82,360 in
cash
the first time he used it. Needless to say, he quit his job
immediately
paid off all debts in full, and started another mailing.

Believe me, this is an EASY opportunity. You can do this all on your
computer,
by "JUST PRESSING A FEW BUTTONS". You will EASE YOUR FINANCIAL
PRESSURES,
and begin to make GOOD things happen for you and your family. READ
ON!

* * * * * * * INSTRUCTIONS * * * * * * *

1. Send $2.00 (cash only) inside a sheet of carbon paper or
construction
paper, and send a self-addressed, stamped envelope to each of the
DEALERS
(1 through 4) below for the recipes they offer.

2 Save this letter on disk. Remove the name, and recipe title that
is in the number 1 position. Move the others up a space. Put your
name,
address, and the name of your recipe in the number 4 position.

3 Post this file just as it appears (with your name, etc.) in 10 different
places on-line (newsgroups, forums, etc.). Do the postings between 6 a.m.
and 7 a.m. Friday, Saturday or Sunday to get the highest position and have
your posting read first. Ten postings should yield about 100 responses,
which
should then yield about $100,000.

4 **When the money begins coming to your HOME MAILBOX, put your recipe
in the provided SELF-ADDRESSED, STAMPED ENVELOPE - sit back, smile, and
know that you
NOW OWN AN HONEST AND EASY SMALL HOME-OPERATED BUSINESS! KNOW ALSO, THAT
YOU HAVE DONE SOMETHING SMART TO ACHIEVE FINANCIAL INDEPENDENCE!

* * * * * LOOK AT THESE FIGURES WITH ONLY A 15% RESPONSE! * * * * *

Step 1: Fifteen dealers mail at least 15 letters each with your name in
position #3 AND send you a request for a recipe and $2 each or $30.

Step 2: Two hundred and twenty five (225) dealers mail at least 15 letters with
your name in position #2 AND send you a request for a recipe and $2 each
or $450.

Step 3: Three thousand three hundred and seventy five (3,375) dealers mail
at least 15 letters with your name in position #1 AND send you a request
for a
recipe and $2 each or $6750.

Step 4: Fifty thousand six hundred and twenty five (50,625) dealers send
you
a request for a recipe and $2 each or $101,250.

TOTAL CASH RECEIVED (15% RESPONSE) $108,480.00
ELAPSED TIME: 30 days! Everyone responding immediately.
ADVANTAGE: $8 Initial investment.

Professional care has been taken to insure that this Marketing Plan does
NOT violate any laws! (Reference U.S. Code, Title 18: Section 1302, 1343,
and TITLE 39, Section 3005).

The key factor is that we are Mailing Merchandise...OUR TREASURED
RECIPES.

Be honest in every way. Be sure to keep accurate records of income
for Income Tax purposes.

GOOD FORTUNE TO YOU!

* * * * * * * * DEALERS LISTED * * * * * * * *

1. Dan McNally (Easy Dump Cake)
26 Cambria Street
Clearwater Beach, Fl 34630

2. G. Bart (Exotic Spaghetti Sauce)
160 NW 176 Street #407
Miami, Fl 33169

3. Jason Meyers (Awesome Oatmeal-Raisin Cookies)
1695 S. 100 E.
Orem, UT 84058

4. Don Anderson (Atomic Salsa)
P.O. Box 3907
Winchester, VA 22601

****
S. Finch -- I made $141,000 the last time I used this program. It
REALLY
WORKS!
****
J.S. Holliman -- I am a skeptical person by nature. But I knew
this program was different. Over a period of 1 1/2 months, I received
a total of $137,870 in the MAIL!
****
P.S. Why not try it yourself? Mathematically it is possible, but
ONLY IF EVERYONE PARTICIPATES! This system works for the BENEFIT OF
ALL, so remember to begin with your name in the #4 position, for
MAXIMUM
SALES and PROFITS! THIS IS EASY AND YOU GET LOTS OF MONEY!!

GOOD LUCK !!!!!

1050. new radio shack scanner

: Andersor@nevada.edu
CHP doesn't use radar in most areas. The best channel to listen to is
154.905 since this is the extender frequency. Otherwise scan 42-43 MHz.

Get a Bearcat 9000xlt instead. It is a much better scanner that the
RS2035. Besides, 10 banks of 100 channels each is NOT usefull. I
wonder what the design engineers where thinking when they designed the
bank scheme?

1057. Need help with Bearcat 250

Newsgroup: rec.radio.scanner
Date: 1995-07-16 00:00:00 UTC
From: 5leitgeb_c@spcvxb.spc.edu
Message-ID: <1995Jul16.161639.1@spcvxb.spc.edu>
Source record: 252379

I picked up an old Electra Bearcat 250 scanner today at a
hamfest. It did not come with a manual(I can't complain since I only paid
$10 for the radio), and I was wondering how to perform certain functions
on the radio. Anyway, here's what I need to know:
1. How do you set the clock?
2. How do you set up the hit counter, and does it
work in both search and scan?
3. What is the "RECALL" button used for?

The '250 seems to be in top condition, since it scans and searches
well, and seems to be as sensitive as my PRO-2006 on the cordless phone
ranges. I've seen BC-250's sell on the market for $100+, so I was
surprised to get one in working condition for $10.
Any help would be appreciated, as would any other pertinent
information on this radio. The '250 should make a nice addition to
my ever-growing scanner collection.

Thanks.
Craig

>a bit of work to get the timing right, but that is also available. It
>has to be, or the displays would not work.

Well, that's not REALLY parallel data that goes to the display. It's MULTIPLEXED data with all sorts of weird things that complicate the simplistic view. I tried that several years ago, before I knew what I was getting into. Made no headway and was later laughed at by those more in the know than I.

The other alternative for cases where the CPU and LCD Display Driver are on board the same chip is to go out to the PLL circuit and intercept the (usually) serial data that goes there. But this is a very complicated data stream, more complex than the serial data between CPU and Display Driver and I never made much headway with it either. The PLL data is the key to the OptoElectronics 456 Interface, though. Somehow they managed to make use of that data, and/or substitute their own with that from the CPU.

cosmo <victorb@cris.com> wrote:

>Can you recommend a Radio Shack TV antenna

Go for the largest one that your budget can afford, consistent with the VHF-UHF-FM (3 in 1) spec. Read the catalog ads closely because come are not FM spec'd. The top two are: 15-2157 and 15-2166 with the latter being a real log periodic and the former, a hybrid of some sort. The former is probably the better, but 2166 is a real mother. Either one should be a hot-dawg.

>and explain the method of mounting it vertically? In other words,
>what would you use for the horizontal mast bar and how would you attach it?

Look at the pictures in the catalog. Now mentally turn them 90-degrees so the elements are straight up and down, and the short mast comes out the side. The end of that short mast is mechanically mounted to a vertical mast that comes up out of the rotator. There are any number of ways of doing this, from a "tee" arrangement to a "vee" mount.... All are mechanical, and I'd need graphics to explain beyond this wisp of the concept. Perhaps the mechanics of the group can go one better here. The key is the short mast to come off the normal mount of the antenna.....say 2-ft long or so.

1063. Scanning CB

Newsgroup: rec.radio.scanner
Date: 1995-07-17 00:00:00 UTC
From: dellis@sedona.intel.com
Message-ID: <3uea6o$gc7@chnews.ch.intel.com>
Source record: 252136

Hey folks,

I have an AOR 8000 scanner, and I can't seem to pick up anything
at all on the CB frequencies. Can anyone tell me why?
Here are a few ideas that occurred to me:

1. Not listening to correct frequencies (programmed the channel
information from Police Call - I think it's right)
2. Not listening in correct mode (AM, right?)
3. Not right kind of antenna (using the coil antenna that came
with the unit, but I tried a Radio Shack telescoping antenna
and I still get nothing)
4. No CB activity (but I live in Phoenix AZ near the I-10 freeway,
and I still don't get anything when I drive around)
5. Radio's AM is defective (but I can get AM OK on the aircraft band)

I've noticed that reception of standard broadcast AM is pretty lousy
(i.e. noisy), but I figured this is not surprising since those
frequencies are down at the bottom end of the unit's range.

Anyone have any other ideas? I realize that maybe CB is not that
exciting to listen to, but it bugs me that I can't pick it up.

Thanks,

Don Ellis

>
I doubt it. Although I don't live near the area I know that usually
NOAA uses the same freq. for alerts as the continuous broadcast.
I am still trying to figure out how to build a decoder w/
an external speaker that could be plugged into the external sp.
jack and be activated only when NOAA issues a warning. It
would break squelch only when it detects the 1050Hz signal that
comes immediately before the warning and then the warning would be
audible. Of course the only problem is that it [the scanner] would
have to be dedicated to monitoring the one channel which
is fine for me but apparently not what you need.

DON'T DO IT!!!!!!!!

DON'T BUY RADIO SHACKS' POLICE CALL !!!!!!

Go to a Ham/CB shop and buy GENE HUGHES' Police Call. It is the same price and both have Gene Hughes' name on them, but that is where the similarities end. Hughes only edits Radio Shacks' version. His own version is a quality piece of work with a breakdown of all fed, state, county, and city agencies and the freqs that they use.

Lastly, if you are in the Southern CA area, take a look at Scan Fan. It is almost twice the price of Police Call, but it is worth the difference if you want detailed local freqs that you can't find easily elsewhere. If you can't find it, call them at (619) 744-2303. I discoved Scan Fan last year and now I don't need any other.

As I understand it, CHP uses their common frequency for handling air patrols--42.34, the so-called "blue channel". Keep an ear to it for the airplanes. Just remember, they don't talk much when they're working, since everyone knows the routine. It's pretty much "blue Honda, number one lane at seventy-five."

|My wife wants to get a scanner for fairly casual listening to one law
|enforcement agency. I don't need one with a lot of memory, features or
|bandwidth. Can anyone tell me if there is a dramatic difference between
|dual and triple conversion? We live about 10 miles south of the
|jurisdiction she wants to listen to. Also, any particular recommends for
|such a radio will be appreciated. Thanks!

There isn't a dramatic difference _per_se_ between dual and triple conversion, but the way scanner manufacturer's have implemented dual conversion (IF of 10Mhz, 455Khz) vs. triple conversion (Very high frequency 1st IF downconverted through lower intermediate frequencies e.g. 455Khz) means that typically, the triple conversion sets have a relatively higher level of immunity to a spurious response called "images."

Because of the very high Effective Radiated Power (ERP) of pager transmitters, done in order to overcome the limitations of the pager receiver's antenna, many scanner receiver's front ends just melt down before all that power. You typically hear this as bursts of digital signals heard no matter where your scanner is tuned to. Some scanner receivers desensitize as well from the multi-megawatt ERP of commerical FM stations.

So, a lot of your scanner receiver choice might be dictated by the Radio Frequency environment near your home. For example, in Chicago, the old Radio Shack PRO-2004 holds up remarkibly well to pager transmitters, but the successor PRO-2006 is susceptible to pager interference due to the design emphasis on increased sensitivity. In an area with low RF levels, all sorts of scanners would suffice, but in an area with high RF levels, your choice is definitely limited. Others will probably recommend antennuators, FM traps, etc. to workaround the design limitations of scanner receivers, which is fine as long as your wife can hear the signal she is looking for...

>Here's my question: if all these amateur repeaters across the country
>have this, then what's the frequency into the repeaters. In other words,
>what is the actual frequency?
>
>Rickey/KD4UCB
>
The repeaters aren't usually getting the shuttle communications
as a usual input but from some ham's tv tuned to NASA Select
possibly their SW reciever tuned to one of the SW frequencies
that broadcast NASA Select worldwide. Even the SW stations
that broadcast the shuttle communications usually get the
audio from NASA Select.
Repeaters in the 144-148MHz area usually have a -600kHz or
+600kHz offset from the output freq so for example if you
are listening to a repeater on 146.610MHz try 146.010 or
147.210MHz. When the repeater is operating normally you can
hear people talking on the input freq (if their close enough)
but when the same repeater is broadcasting the shuttle
the input freq will be silent (should be anyhow).

Aha, so all that money spent on the drug problem is really being spent on
something else? Interesting theory. I can understand why somebody needs
to keep up with what the police are up to.

From: debrantley@aol.com
Message-ID: <3ueuos$34m@newsbf02.news.aol.com>
Source record: 252158

Can anyone reccomend a good scanner antanna. I live 30 miles east of Chattanooga, Tn. and cannot receive them. Thare is a small mountain between us and them. They operate on UHF. I have an outside antanna. It is from Radio Shack. Its the one for around $30.00. I have it 30 feet in the air with RG-8 running about 50 feet. I had considered buying one of the scanner amplifiers from Scanner World, but have heard different responses on them. Can anyone give me some feedback on them. I can pick up VHF up to 50 to 60 miles off. I want to monitor Chattanooga though.

Hey Trance,

I live in West County also. I don't know of any clubs, but I would be interested in exchanging frequency info etc. by E-mail.

I can tell you the address of Monitoring Times is P.O. Box 98, Brasstown, NC 28902-0098. Or you can save a stamp and call Grove (the publisher) at 1-800-438-8155.

If you happen to know of any ACTIVE UHF freqs for military aircraft in the area, I would be interested in knowing about them.

Dave S.

From: cobra295@aol.com
Message-ID: <3ufahh$7u5@newsbf02.news.aol.com>
Source record: 252166

Scanners aren't really great for CB... and in many places it's just not that active anymore.. but I would try 27.185 AM (CH. 19) .... If you listen there for a while and don't hear anything... I would say you need to check your setup... probably a better antenna would do the trick... the internals never really work that well... they're really just for local service freqs. Good luck..... and don't spend too much time RXing CB... it's not worth the effort. :)

Source record: 252294

Of all the neat radios on the market (AOR 8000, Bearcat 9000XLT, RS PRO-2035, etc.)
It sure would be nice if someone would put PL/DPL/DTMF capability into a handheld unit.

I would guess that Uniden could do it, since the 9000 has at least regular PL as an
option, and the alpha display is really a great feature. Wouldn't it be slick to have
a unit you could use in downtown USA with PL decode and a 10+ character alpha display?
Of course, some sort of FSK demodulator option would be nice too...

Hello? Uniden? Are you listening?

Just an idea.

Doug

1106. Re: FS: PRO 2006

Newsgroup: rec.radio.scanner
Date: 1995-07-17 00:00:00 UTC
From: faraute@ERE.UMontreal.CA
Message-ID: <DBu3nI.K5p@cc.umontreal.ca>
Source record: 252295
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've been reading that the PRO-2006 was discontinued.
But after a trip to the closest Radio Shack here in
Montreal, Canada, I found out that they're still selling
them. My local store has 3 brand new models stacked
in the back room. In fact, every store I called in the
greater metropolitan area had at least one model for
sale. Catalog price: $539.95 canadian. Same deal for
the PRO-43: they're on sale for $329 until the end of
july and the models are modifiable (no A's in the ser#).

So if you're looking for a new PRO-43 or PRO-2006, fresh
from the box, drive on up to Canada. The exchange is
miraculous anyway.

>listen to them.

Robert, with a huge commercial presence, there is no doubt that now and then that some (independant) Motorola -Dealer- might make a statement that is not based in fact.

However as an attendee at numerous regional and national conventions devoted to Public Safety communications, I have -never- heard any official statement from a Corporate Employee (Motorola or others) to infer that the trunked system will somehow prevent an agency from being monitored by the public.

A cursory search of recent editions of the APCO Journal finds no mention of such an attribute in any of the trunked radio advertisements.

If an agency needs to secure their communications, there are many, many other (cheaper) options than building an 800 MHz system that has a reliance on trunking.

It sure is an exasperating issue!

Happy Monitoring!

From: swilcox@cyberport.com
Message-ID: <3ucfij$8vr@macaw.cyberport.com>
Source record: 252306

I have a like-new pre-ban RS PRO-46 covering 806-956 MHZ with no gaps.
I have absolutely no desire to listen to cellular conversations,
however I would like very much to have the Military Air Freqs. in the
175-406 MHz range. I would prefer a PRO-43 or something that has
continuous scanning from 29-956 MHZ, less the cellular freqs.

From: jasonl@cts.com
Message-ID: <DBuKEF.FE8@crash.cts.com>
Source record: 252311

Hi there,

I have an ICOM R7100 which works perfect in every way except that it gets hot, much hotter than I feel is good for it.

I've placed a tiny muffin fan over the top vents and that keeps the unit fairly cool, but I was wondering of other owners of this receiver have found they run hot too.

BTW, this is my SECOND 7100. The first one I had for two weeks also ran quite hot. I exchanged it for a different reason, however. The receiver would go DEAD when I would use window scan between 150MHz and 800MHz. Not a good thing.

I picked it up this weekend and played with it. It's useful in getting rid of constant static or whines. It does, however, tend to clip the high-freq end of the signal along with the static.

It sometimes helps provide clearer reception; occasionally, however, it makes it worse, especially with weak signals, which it tends to cut along with the noise.

I've found it particularly useful in cutting the noise from some stronger SSB transmissions (it has both SSB and CW settings in addition to the NR setting). Haven't played with the CW setting yet.

It's worth the 50 bucks as a occasional help; don't know if I would shell out the list 80 bucks though (and the 3-year ESP is 40 bucks - almsot as much as the sales price!).

AM>From: dorian@coho.halcyon.com (Aaron Mitchell)
AM>Subject: Building My Own Transmitter

AM>This is to anyone who knows a little about radio construction. I wanted
AM>to play around with some low wattage (.5 -> 2 watts approximatly). I
AM>would like to build my own, or build from a kit a transmitter, but how
AM>hard is it to change the transmission frequencies? Specifically I'd like
AM>to transmit in the 30s to upper 40s Mhz frequencies. Does altering a
AM>transmitter's frequencies require alot of deviation from the original
AM>schematics?

You also need to know more than a little bit about the law. You are not allowed to construct a transmitter of any power you decide and operate it on just any frequency! Upper 30s to 40 Mhz might just put you right on top of your local police department if they are using older equipment.

Frequencies for what you are talking about are available around 1.8 Mhz, 27 Mhz, 49 Mhz. It is not too hard to change transmission frequencies, but it might require removing and reinstalling a crystal, if the transmitter is crystal controlled, along with some readjustment of the tuning circuits.

A fairly safe avenue for you to explore might be to get a no code amateur radio license which would allow you to operate on 2 meters (144 Mhz. Then you could easily find information and diagrams and help from other amateur radio operators. Also the power allowed is in the range you are talking about.

From the questions you are asking, it seems like you probably need to get a bit more experience just building and operating things for a while. Building a transmitter from scratch is not a simple matter without enough test equipment and it is hard to get things stable without a fair amount of attention to position of components, length of leads and traces, etc.

1128. Re: 800 MHz Trunking.....

Newsgroup: rec.radio.scanner

From: peter@lsis.st.3com.com
Message-ID: <3758@bridge2.NSD.3Com.COM>
Source record: 252317

Here's my prediction:

Someone in the near future will produce a scanner _designed_
to be run by a PC. This means that the box itself won't be much more
than a digitally tuned receiver, and may not even have a display
or a speaker. You'll need a sound card and a serial connection and
all the audio will come over the PC's sound card.

Here's the good stuff. Is this a scanner? Probably not.
Will it be required to block cellular frequencies? What else
can you do with a sound card besides pump audio through it?
I've got programs to do spectral analysis, oscilloscope emulation,
POCSAG pager decoding, and DTMF decoding. All downloaded from ftp
sites.

Trunking and MDT transmissions aren't as easy to monitor as
normal single-channel FM. But they're not impossible to monitor either.
Someone, sooner or later, is going to figure out Motorola's trunking
control channel. Moto's lawyers can't stop them. After all, if
someone deduces the format of the transmissions from monitoring information
transmitted over the air, they didn't breach any contractual agreement.
Of course, even monitoring a control channel is probably illegal
under the ECPA :-(

Things are about to get interesting for those with computers
and brains.

Cheers,
Peter

The '7100 is quite a receiver, but the internal power supply is very inefficient, and runs hot. This heat is not good for the receiver.
You might try running the '7100 from a regulated 12 volt DC converter. This way, you can unplug the '7100's power cord, and the receiver will run much cooler.

Yessss! It's almost one of those for sure things in Life. Almost.

> Bc> is about the extent of the needed work.......which remains easier said
> Bc> than done, by virtue of the necessary micro-wiring of the header.....

> Granted...but an experienced tech should have no problem with the wiring.

Wiring isn't the problem, as I see it. It's positioning the sucker on
some sort of a header and integrating it into a cohesive unit without
breaking pins off the new CPU before they're rigidized. i.e., this
could be quite a little manufacturing job. And I've only dreamed
about it to date.

> Bc> If he did not mess around inside > Bc> the unit to speak of, I

Methinks a good long term solution would be to replace the EL Panel
with a thin, frosted glass slide, behind which are mounted a dozen or
so high intensity LEDs or even a couple of incandescent bulbs.

> While we are on the topic of 2004, I got a message from someone on CI$
>that you no longer recommend the squelch mod and that you changed your
>scanners back to factory condition in this circuit. Is this accurate? Is
>the factory method the recommended?

That's not true at all. It's the crystal speed mods that I'm not keen
on anymore. There are serious tradeoffs when upping the speed with a
rock. Ungood. The squelch mods are perfectly ok, however the
PRO-2006 contains a factory upgrade to the squelch circuit that makes
a mod really not necessary like with other scanners. IC-10 changes

the SQ Hysteresis curve between Squelched and Unsquelched states for an optimal compromise. No other scanner has this feature of which I am aware, and so SQ mods for them are worth a look.

Most can "copy" the PRO-2006's use of a CMOS bilateral switch to change the hysteresis resistor, too! It's cool.

> I don't have the freqs (sorry), but you don't need them to avoid CHP radar
> traps.
> The CHP doesn't use radar.
.
OK Bill...get the Fire Extingusher ready.......

HERE WE GOOOOOOOO

The CHP is not allowed (by state law) to PURCHASE radar units with state money. The CHP has found that some countys will purchase the units for them(clever) for use on county roads and STATE highways. The CHP CANNOT use the radar on INTERSTATE highways (the ones that get federal funding). Before radar can be used however a study must be done and presented to the CHP and county Board of Supervisors for approval. If approved ,the public is warned...the areas are outlined and a few months(really about a year)later the county buys the radar unit and gives it to the CHP to use. When the radar units approach the end of their service life they are given to the public works department so they can clockthe speed of the softballs during the 'big game'.
Now I may have be wrong on some of this...but I'm so arrogant that I don't think so (:-)
Just in case...I have a REALLY BIG halon extingusher ready to go and a nomex suit at my side.

all in fun

We've haven't really had any other complaints of this nature. If you
bought your AR8000 in the US it's under warranty for 1 year and I'd
be glad to have our service dept. check it out if you'd like.

1144. Need help with Tennelec MS-2 programming

Newsgroup: rec.radio.scanner
Date: 1995-07-18 00:00:00 UTC
From: 5leitgeb_c@spcvxb.spc.edu
Message-ID: <1995Jul18.101407.1@spcvxb.spc.edu>
Source record: 251884

Does anyone have a formula or guide for programming and old
Tennelec Memoryscan MS-2? I recently picked one up at a hamfest without
a manual, and I have no idea how to program it. Guess I'm just a sucker
for old scanners :) The scanner does work, as I can hear some active
frequencies that were already programmed into it, but none of them are
of interest.
The scanner uses a binary code for programming, as evidenced
by the "0" and "1" keys on the front. Any help on the programming would
be greatly appreciated, as would any other information, such as how old
this scanner is, and if the Tennelec company is still in business.

Thanks in advance,
Craig Leitgeb

Please don't take a Shadio Rack's salesperson word on that. Ask them
for the service number directly, Tandy claims to support their products
for more than 10 years and their service dept will not tell you it's
not worth fixing, unless it was hit by lightning.

The sales guy might be trying to get you to move down to a 2035. Don't
give up, the 2006 may still be worth fixing.

I thought the same thing before looking closer. If I remember correctly
this interface uses pin 5 instead of 6 on the DB25 from the op amp
output. I do get a spinning wheel on the top line (made by /-|\).
Don't get any data on the screen. Haven't had time to find out why.
Probably volume setting level or wrong freq.

>lat/long coordinates? I know there are several ways of doing this - I
>need one which is accurate to approximately 1 mile in 300.

The formulas (far more accurate than you require) are as follows:

Given:

LAT1 = your latitude
LONG1 = your longitude
LAT2 = target latitude
LONG2 = target longitude

(All in degrees (and fractions thereof), northern latitudes
are positive, southern latitudes are negative, western
longitudes are positive, eastern longitudes are negative)

If your trig functions require inputs to be in radians,
convert using radians=degrees*PI/180, and convert outputs
back to degrees using degrees=radians*180/PI.

Distance:

D=invcos(sin(LAT1)*sin(LAT2)+cos(LAT1)*cos(LAT2)*cos(LONG1-LONG2))

D is the angle covered by the arc across the earth's surface
from you to the target (from zero to 180 degrees)

Distance in nautical miles=D*60 (1nm=1 arc minute)

Distance in statute miles=D*60*1.15078

Distance in kilometres=D*60*1.852

(BTW, invcos is the inverse of the cosine function, i.e.
cos(45)=0.7071..., invcos(0.7071...)=45)

Bearing:

B=invtan(sin(LONG1-LONG2)/
(cos(LAT1)*tan(LAT2)-sin(LAT1)*cos(LONG1-LONG2)))

B is the angle to the target, where zero degrees is north, etc.

invtan will only return angles between -90 and +90 degrees.
If the target is south of you, B must be adjusted to reflect

the true angle, i.e.

```
if (LONG2 < LONG1)
B=B+180
```

That should get you started...

DJBlu <djblu@aol.com> wrote:

>The pro 26 has tripple-conversion. This eliminates images.
>Sorry!

By choosing a high first IF, up conversion moves the image frequency
much further away from the signal frequency. That makes it easier to
filter out the image unless you broaden the front end filter or
fail to use adequate shielding. Poor RF shielding will permit undesired
signals (e.g., images) to jump around the filter (aka "filter blow-by").

The Uniden-manufactured Radio Shack PRO-26 and Uniden/Bearcat BC3000XLT
portable scanner both employ triple up conversion but differ in
features, construction, frequency coverage, and RF and AF performance.

Both receive images, even though they are triple up conversion.
I compared image rejection and other parameters of the PRO-26
to the BC3000XLT. Test results will appear in the August 1995
issue of Monitoring Times, available in about one week.

a Scanner Frequency Database Program for windows?
<

Hi Scott,

I believe my Frequency Manager for Windows program is available at the
following sties still.

The program is available as FM.ZIP at the following places...

CompuServe's HamNet Scanning Library

America Online's Ham Radio Area's Software Exchange (30Mhz and Up)
ftp oak.oakland.edu /pub/hamradio/pc/ham-utils

Or if you don't want to download it, or don't have access to the above,
send $3.00 to me for the unregistered version, or $15 for the registered
version, and I'll send you a 3.5" disk with Frequency Manager. The $3.00
can
be applied towards the registration fee if you decide you want to
register.

Don't forget shareware. If you don't like it, don't buy it.

I know my program isn't on your wish list but just in case you haven't heard of it, I thought I'd let you know.

I write a program called Radio Manager for Windows. It controls Icoms and the OptoScan456.

The program is available as RM.ZIP at the following places...

CompuServe's HamNet Scanning Library

America Online's Ham Radio Area's Software Exchange (30Mhz and Up)
ftp oak.oakland.edu /pub/hamradio/pc/ham-utils

Or if you don't want to download it, or don't have access to the above, send $3.00 to me for the unregistered version, or $30 for the registered version, and I'll send you a 3.5" disk with Radio Manager. The $3.00 can be applied towards the registration fee if you decide you want to register.

I have an RS PRO-2006 scanner for sale for $100 including shipping. There is a problem with it. First the receiver is weak, it will only pickup VERY strong signals, everything else is ignored. Second, the BATT light is always on (even if you replace the battery), and while it is scanning (or just turned on), there is a BEEP every few seconds.

I am sure someone out there can use it for parts or whatever. I also have a copy of the manual. Please be advised that RS says it would cost more than it is worth to fix it.

33.900 is a big Freq. in Southeastern Pa. And yes it is possible
because similiar incidents happen to me all the time. I live In
Northeastern Pa. I hear from 100 miles away at times to Calif. but
only on the low bands. No set pattern it's the earth, weather, and
such. Nick

1170. AOR800: How do you like it?

Newsgroup: rec.radio.scanner
Date: 1995-07-18 00:00:00 UTC
From: michael@alexander.terranet.com
Message-ID: <michael-1807951954240001@alexander.terranet.com>
Source record: 251910

The AOR8000 has been out for a while and I'm curious what scanner owners think about it. Early on, there were a number of comments by people who complained about flimsy construction, labels wearing off and so on.

What about the interface(s) and software? I've seen several negative comments about the interface sold by EDCO. I'm not sure if there are others. I'd be curious to hear what users have to say about its flexibility and usefulness.

I understand that the unit can be unblocked via an interface and software, although I'm not clear on whether that's EDCO's interface or someone else's. I assume the software is one of the many that are named Scan Something Or Other.

Thanks in advance for any info you can provide. $600 is a lot of dough--is it worth it?

Alot of people have been asking for these. They are on one of the nasa
web sites. Something like http://garc/www/retransmission/retransmission.html

these are the WA3NAN (goddard Amateur Radio club) official transmissions
on HF. There 2 meter freq is the one that someone mentioned in Washington D.C.

3.860 kHz (LSB) 80 meters
7.185 kHz (LSB) 40 meters
14.295 kHz (USB) 20 meters
21.395 kHz (USB) 15 meters
28.650 kHz (USB) 10 meters
147.45 mHz (FM) 2 meters

other repeaters may rebroadcast the transmissions on other VHF/UHF freqs
around the country/world.

hope this helps someone.

I have an older issue of Gene Hughes' police call in front of me at the
very second, I was using it to provide information to another poster
about CHP frequencies. What you forgot to mention is that yes the
frequencies are broken down, but they are also defined as to thier use.
For instance the Rat Shack book will say for LA county that a frequecy is
"Blue 8". Gene's book says Blue 8 Countywide Dispatch, and Blue 12 North
County Tactical. Go get this book! A great reference, the index section
where frequencies are listed by number actually has the breakdown and use
as well as opposed to simply the name of the licensee.

BTW, does Gene only produce a Southern California edition? IMHO he should
at least include Santa Barbara County in the SoCal edition

>they have a a way to put several calls on the same frequency,

Digital cellular is already in operation in many areas of the country.
It called Time Division Multiple Access (TDMA). It is the current North
American digital cellular standard (IS-54). It digitizes, then mutiplexes
three conversations into the space of one conventional analog cellular
(AMPS) channel.

CDMA (IS-95) is currently undergoing testing. CDMA (code division
multiple access) uses direct sequence spread spectum to place
798 users in each of 20 channels, each channel being 1/20th of the
existing North American cellular spectrum. I am not 100% certain
of these CDMA figures, but it gives you and idea of it's "promised"
spectral efficiency.

When TDMA and CDMA become far more popular than analog
cellular, those who listen in on cell conversations via scanners
will be outta luck. The creative and knowledgable will hack the
cell phones themselves to accomplish the task. Indeed, some
cell phones have back doors (they contain software, of course)
that do just that.

However, if/when digital encryption is added ON TOP OF the
already digitized signals, interception will invlove much more
effort than "simply" hacking the phone or accessing a back-door.

> For what it's worth, I rode Amtwack from L.A. to Portland, OR and back
> earlier this year, and they used 161.55 at both ends, and 160.315 in the
> middle.

Correction: 160.315 isn't a valid RR frequency. I know SP uses 160.32
(AAR channel 14) though, so your scanner was evidently able to pick up
the signal just a little "off frequency". The other frequency 160.55
is valid (AAR channel 96), and is also used by SP as one of their "road"
channels.

As I recall, SP also uses 160.95 (AAR channel 56) and 160.89 (AAR channel
52) as PBX frequencies.

For RR frequency info requests, it's a good idea to cross-post to one
of the misc.transport.rail.* groups or the supposedly obsolete (but still
active) rec.railroad.

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every two weeks until there is demand for its removal. In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be

modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive? Units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). [There have been *no* reports of a modifiable 3A4 unit.]

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---
4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH
easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the
batteries usually lie. You'll see the diodes there. Simply take an
xacto knife and and break the solder on the D4 diode (left-most on
mine) on the side facing you. I just cut back-and-forth for a bit.
Once the solder (it's surface mounted) is weak enough, I just bend up
the diode a bit from the PCB. Presto. I left mine hanging on the one
side with solder. If you continue to work it a bit, you can probably
remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading
many of the praises for the Pro-43 on this newsgroup. I decided to try
and MOD it, but don't have a lot of experience with a soldering iron.
After examining the scanner's innards, I found it was quite easy to
"fix" with nothing more than a minature philips screwdriver and some
small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of
microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and
other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by
four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European
version of the PRO-43 has different coils and capaci-
tors in the low (mid) band front end filter. That
explains why the 75 MHz sensitivity isn't stellar after
adding diode D3 to enable 30-88 MHz coverage.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the
PRO-43! Only a simple circuit and your choice of meter, analog or LED, is
required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom
(solder side) of the AF Board (middle board). You will need the Service
Manual for the PRO-43 to find it as it's not marked and it would take me
10,000 words to guide you to exactly where it is located. Call Tandy National
Parts at (800) 442-2425 to order your manual: approx $10. Now here is the
deal:

Locate D-302 and either build the following circuit right there on the back of
the AF board in the vicinity of D-302, or solder a wire to the cathode of
D-302 and route it to somewhere else more convenient to feed the below
circuit. This wire ought not to be very long, though, say not more than a
couple of inches. Refer to the ASCII schematic diagram as follows:

PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)

```
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry
```

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)-----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal

strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit

board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

Jay,

Channel 9 & 10 are basically point to point. The 19.20,24, and CPP are the 4th Div. For Ch 9 check 470.7875mhz. Not sure of Ch 10.If you live in the metro NYC area you might want to purchase Scanner Master, NY Metro/No.NJ edition. 5th Edition came out in 1993 and covers Everything Fed to Local. I purchased mine at Gilfer Shortwave in NJ 201-391-7887. Goodluck.

If you are authorised to receive these transmissions, there's one in the
radio they issued you.
If you are NOT authorised to receive these transmissions, there are shadowy
ways of getting such a radio, but they are expensive, and your use to
receive these transmissions is illegal.
IOW, unless you are VERY well connected, you can't get one.
Also, don't believe those who tell you that your computer can decode the
transmissions. It can't.

Steve:

I did an online search as Stanford using Inspec. There are no legit
sources for this information. I have looked at the audio from the
San Jose PD on a spectrum analyser and don't recognize the modulation
scheme. It does not appear to be GMSK or FSK. Even if you could
demodulate the signal, you would need to decode the encryption,
which would pretty much require insider information. Every terminal
has an address and if stolen (which has happened) can be effectively
bypassed. Now if you find a disgruntled Moto employee, hey then we
got something...

Hi Bill.

An interesting thought might be to replace the CPU with the same type but with an upgraded programme that would allow more versatility on all fronts. The "Chipswitch" for the Uniden HR2510 etc. radios comes to mind here. Of course this requires a great deal of rather specific knowledge to do but it wouldn't be impossible. Antoher technical challenge might be to replace the SMT CPU. <G>

Cheers!

Andy

let me count the ways.....

*with screaming, teeth-clenching, tear-jerking envy. A psychiatist
*friend of mine says you are, anyway. That's how he evaluates your
*messages.

During one of your weekly visits I'm sure.....

*So why do you keep coming on to me? I must have something you want.

See above re: YOU keepin' the fires burnin'

*Watch.

Oh, I'm watching real' closely. <yawn> Wake me up when there's something
worth checking out.

*Ok, now who are you?

Wouldn't you like to know.....

*No. You're just ill-trained and steeped with a lot of horsefeathers
*from your CB activities.

What does CB radio have to do with anything I said?

*1. TV antennas for the USA (may be different in Canada) are expressly
* designed as follows:
*
* 54 - 88 MHz
* 88 - 108 MHz
* 174 - 216 MHz
* 470 - 890 MHz

Not only are they NOT designed in this manner explicitly for Canada I
highly doubt that they are engineered exclusively like this in the USA.

Unless a TV masthead is specifically engineered for all of these
bands (in which case it would be an VHF/FM/UHF antenna) it would
not fullfill the "has more gain that the Create LP Antenna" which
is what you initially posted. Your post was misleading and superficial
and did not address the question. And even if it were the above type
it would not have equivalent gain in the bands most scanner folk'
are interested in. Cheek, I think your mouth (and in this case your
hands) move alittle faster than your brain.

*2. In order to get specified performance at the band edges, the
* antenna will be "overdesigned", meaning that positive gain will
* be apparent well outside the bands of design.

Cheek, you're gonna have to trust me on this but the above is simply
not true and varies so radically from antenna to antenna that it's
not sound advice to give someone.

*The simple conclusion which can be empirically demonstrated with
*minimal effort is that a TV antenna will perform well above a discone
*at 343 MHz, a point halfway in the gap of 216-470 MHz.

Cheek, ANYTHING performs better than a discone antenna! If you loaded
up your jock strap it'd work better than a discone!

I deleted the rest of your message without reading because you've wasted
more than enough of my time.

I eagerly await the publishing of one of your dissertations in
the IEEE Spectrum.........I think it'll be a long wait......

Cheers!

Andy

I don't think so. The HR2510 is manufactured in various versions - so the
different chips already exist. This is NOT the case with the various scanners.
You would have to design and build the CPU from scratch - to emulate
everything that is done by the original chip. This is a massive undertaking,
and would not be cost justifiable for the volume used in scanners.

They started when the available frequencies available started to get overloaded. Trunking makes more efficient use of the bandwidth available.

To follow the conversations automatically requires that the control channel data stream be decoded. Your scanner would then have to be programmed for the talk group you desired to follow. So far, no scanner or after-market kit has appeared that will do this.

If there are not too many channels, then you can follow the converstations somewhat successfully by manually pressing the scan button until you find the channel in use again. If the system is busy, you can just about forget it.

BC> Either one should be a hot-dawg.

Bill,
#15-2157 uses a corner reflector; that may be what you mean by "hybrid".
It's a log periodic, just with the reflector added.

Personally, I can't use that kind of range here, as only the West is open;
the other directions are enclosed by mountains.
Well, wait a sec...

T> Where would one find the cellular images on the RS Pro-26?

First, find what the first IF is.
Double it.
Images will be found THAT far from the 'real' frequency.
So, let's say your first IF is 10.7 MHz. Doubled, that's (let's see, 20 plus 1.4...carry the three... drop the zero.. heck, lemme have my calculator..) 21.4 MHz.
So, the images will be 21.4 MHz away from the original freq.
That means that the cell images will be found either 21.4 MHz above or below (depending on the scanner model) the cell frequencies.
Does that help?

DE> and I still don't get anything when I drive around)

My experience with a real CB leads me to believe that #4 there is the right one.
I live very near 43 Ave. & Peoria (West of Metrocenter), and all I have ever gotten on my base radios has been a bunch of punk kids threatening each other over who has the better (most powerful) CB rig. And not much of that. Even on I-10 or I-17, there doesn't seem to be much activity, although I have been able to get responses to my calls, so I know the CB'ers are there.

Hey, Don, tomorrow (Wed., the 19th), there will be a listener's supper at the Denny's at I-17 & Dunlap, on the NW corner. Your'e welcome to come & get some good Denny's food (!), and some comaraderie with other listeners. Pick up a Radio Room Report, talk radio trash, maybe get & give some info. 6:00 pm.

SOME DELETED

I tried one of these shortly after they came out.
I tried it on my scanners, and found it to be an overall dud; it actually
mad the audio worse, as a rule.
To be fair, the signals I listen to are usually full-quieting, and
need no tweaking.
Then I tried it on my SW receiver, a Kenwood R-5000. On strong signals, I
could do much better with the notch filter and/or RF shift.
On weak signals, the DSP unit seemed to make a difference, and actually made
the audio better. Then I ran into the next problem: the audio amp in the DSP
unit is horrible. The unit requires the input to be low, or it overloads.
The audio amp has so much distortion that, without using headphones, it
distorted the audio so badly, I was better off without the DPS in the
system.
It went back for a refund.
Just my findings. Your mileage may differ.

Daren,
Your problem with UHF is that signals there tend to be very line-of-sight;
that mountain is killing you.
A "booster" will boos ALL signals that it sees; this means that it will
boost the noise as well as the signals you want.
What you need is a directiona antenna, to provide a bunch of gain in the
direction you want. You might look into using a TV antenna, rotated to the
vertical position. Excellent gain, relatively low cost (easily under $200,
including a rotator, for a decent system).
We were in Chattanooga in April. Really liked the aquarium!

d> interface type?

Yes, it's mainly the Hamcomm interface, but the output signal of the
Hamcomm circuit is connected to DSR of the RS232, while the output of
the POCSAG interface is connected to CTS. I have modified my Hamcomm
interface from DSR to CTS and it works fine!

Hello All,
I have been an avid scanner nut for a number of years, I have
recently gained intrest in the use of my PC to control scanner
activity! which brings me to my question:
1. What would a good scanner to use w/a PC, or is there a FAQ out
there that I could possible read that would give me a little "insight"!

Thank you for your professional opinions!

: -> have an amateur MN> radio handbook which shoul;d describe how to
: -> build a BALUN which is MN> what you would need.

: ^^
: This I agree with. But not REALLY needed. You will still do
: better with a mis-matched line, hooked to the T.V antenna, than if you
: used the stock antenna that came with the radio. Actually, the
: transformers MAY actually help a little due to the fact that after
: concversion there would be less of a mis-match than without them.
: 75 to 50 Ohms, compared to 300 to 50 ohms. The greater the mis-match,
: the greater the loss. An antenna PRE-amp really performs miracles. I
: recommend it to anyone that is not suffering from intermod. The best
: idea would be to put up another antenna, that IS 50 ohms, and in the
: process eliminating any need for an impedance matching device that will
: cause a slight loss in signal. ANYTHING inserted into the line whether
: it be a balun, or even so much as a coax connector will exibit *some*
: loss of signal. Best to avoid anything of this type. Especially at
: higher freq's.

: -> GOOD NEWS! The scanner won't be able to tell the difference between
: -> 50 ohms and 75 ohms, so use the standard TV transformer. If working
: -> with a transmitter, the difference would make a difference. Since
: -> scanners are only receivers, no problem.
: -> Bill Funk
: -> Internet: bill.funk@iotp.com

: ^^
: This I DO NOT agree with.

: Check out the ARRL antenna handbook. Whether the radio is the power
: source (transmitting, power going *toward* the antenna.) OR, whether
: the antenna is the power source (receiving, power going *toward* the
: radio) any difference/change in medium that the signal must transverse,
: will cause part of the signal to be REFLECTED BACK toward the source.
: In this case, the "change" in medium would be the difference in
: impedance across the line. Or, if the antenna was 75 ohm, and the line
: was 75 ohm, the change would be at the input at the radio. Which in all
: probability is 50-52 ohm. An easy way to picture this....
: Ever went swimming? Can't hear noises coming from under the water?
: Stick your head under the water? Now what do you hear? Can't hear a

: train coming? Put your ear to the tracks? Now can you hear it?
: Remember the indians? They would put their ear to the ground so they
: could hear the horses coming. Why? Because that was the only
: way they COULD hear it. In order for the sound to reach them, it
: would have to transverse through a different medium. The sound
: travelled through the ground fine. But not through the air. Again,
: a change in medium. In both cases the sound/energy/wave/signal, whatever
: you want to call it, is a lot weaker when it must transverse
: through/into a different medium, most or all of the energy "stays" in
: the original medium it started in. One question that comes to mind: Why
: is it possbile to hear the train/horses/etc through certain types of
: mediums, and not through the air? Because under normal circumstances,
: the air is a piss-poor conductor of most types of energy. Where the
: ground/train-tracks/water is much better.

: Johnny

: I apologize if I am not very clear on this. Due to the limitations of
: email, it was the best I could do to get my point across. If anyone
: wants to debate my energy/medium theory, fine. Intelligent conversations
: welcome. Flames will simply be ignored.

: | Internet: Johnny.Smith@odxabbs.tor250.org

No one has even talked about the fact that a 20 - 30 db loss exists between a horizontal antenna vs a vertical antenna. Most of the things that one wants to receive on a scanner use a vertical antenna. The loss encountered in a balun would only help in keeping down the intermod. The loss encountered in a horizontal antenna is worse. When one can build a 1/4 wave VHF vertical, and attach it to the TV antenna (for the visual effect) why bother with a horizontal TV antenna. It only take 5 minutes to build one, and put it in place.

Thanks for reading

>thing.

I took my first 7100 back after a couple of days because of the heat problem. The second one got just as hot. Seems it is a basic design flaw in the PSU.

My solution has been to run the unit from an external 12V PSU. Not a neat and simple solution but it works perfectly and because I never move the radio around it doesn't inconvenience me.

I was very annoyed at the time of purchase though that such a piece of equipment could have such a fundamental problem.

I seem to remember a couple of years ago that the BBC (in the UK)
were developing a standard for digitial FM radio transmission (of
Audio). I don't remember a great deal about it, but seem to remember
that ther was an article on it (DAB=Digital Audio Broadcasting) in
the UK magazine "New Scientist" about 2-3 years ago. If you _really_
wanted me too, I suppose I could go through that huge box of magazines
in my shed, but I'd much rather not have to...

: Thanks

This is a real good scanner, I have noticed that if you wish you can
listen to cell images between 894.? to 915.00 I havent tried to hard to
catch them but they are there.

Positive:

1) Great Audio
2) DayLight - easy green, stays on for 20sec
3) Duplicate program warning
4) Direct button for the handy channels.
5) 1 Pri for each bank of 10 channels

Negative:

1) Only search by bank, cannot define limit
2) only 100 channels
3) Buttons are two sensitive...Personal pref.

>Greg KO6TH

I agree that for a 'nearby' transmitter you won't notice the
diference. Iif I calculate it right the VSWR of a 75 ohm antenna and a
50 Ohm receiver is 75/50 = 1.5 to 1. This is well within the
acceptable range. However, since it will represent a 20% (It doesnt
apear as much if you experess it in Db (0.9Db)) reduction in received
signal strength as compared to using a 1 to 1 match its worth
considering the effects on 'distant' signals. If were to raise your
received signal strength by 20% in an FM system (which most Public
Service systems are) it will increase the intelligibility of distant
signals.

Since Most scanner listeners put up outside antennas in order to
increase our range, The effects could be worth the effort.

As an asside to the discussion, Would you advise turning the 'TV being
used for scanner' antenna 'on its side' since this sets it vertical
rather than horizontal polarization?

Marc

I would hope that you tried messing around with the switch on the back
that reduces the GAIN? The ATT. switch on my radio starting acting
up---sort of. I just flicked the switch back and forth about 50 times to
make the connections better. VOILIA! The reception came back better than
ever!

AND... I have the same battery problem! I ended up sending for the
Service manual - MINES A 2005. With a few clues from Bill Cheek, I am now
ready to dig into the radio and look for the bad component. It doesn't
look like a big deal to fix, I just haven't had the time to fix it.

So...if you want to try these options, get a service manual and I'll fill
you in on the info that Bill gave me as to where to look for and fix the
BEEPING. (god I hate that!)

My second post....hope it makes it!

John Fischer

>Could it actually be "SOCAL"?

What it is actually is SELCAL, short for SELective CALling,
which enables the aircraft to not continuously monitor a
frequency while in flight, but allows it to be called by the
International Flight Service Stations for messages...works on
much the same principle as paging tones. 4 alpha-codes
are assigned to an aircraft, and to contact them the IFSS
punches up the code on their transmitter, which activates
the receiver in the aircraft.

1234. MDT's (again, and again...)

: made it your mission in life to try and gag me. YOU are the two-faced,
: lying scumbag that I (and many) have come to know. How I loathe thee -
: let me count the ways........

: *with screaming, teeth-clenching, tear-jerking envy. A psychiatist
: *friend of mine says you are, anyway. That's how he evaluates your
: *messages.

: During one of your weekly visits I'm sure......

: *So why do you keep coming on to me? I must have something you want.

: See above re: YOU keepin' the fires burnin'

: *Watch.

: Oh, I'm watching real' closely. <yawn> Wake me up when there's something
: worth checking out.

: *Ok, now who are you?

: Wouldn't you like to know........

: *No. You're just ill-trained and steeped with a lot of horsefeathers
: *from your CB activities.

: What does CB radio have to do with anything I said?

: *1. TV antennas for the USA (may be different in Canada) are expressly
: * designed as follows:
: *
: * 54 - 88 MHz
: * 88 - 108 MHz
: * 174 - 216 MHz
: * 470 - 890 MHz

: Not only are they NOT designed in this manner explicitly for Canada I
: highly doubt that they are engineered exclusively like this in the USA.

: Unless a TV masthead is specifically engineered for all of these
: bands (in which case it would be an VHF/FM/UHF antenna) it would
: not fullfill the "has more gain that the Create LP Antenna" which
: is what you initially posted. Your post was misleading and superficial
: and did not address the question. And even if it were the above type
: it would not have equivalent gain in the bands most scanner folk'
: are interested in. Cheek, I think your mouth (and in this case your
: hands) move alittle faster than your brain.

: *2. In order to get specified performance at the band edges, the
: * antenna will be "overdesigned", meaning that positive gain will
: * be apparent well outside the bands of design.

: Cheek, you're gonna have to trust me on this but the above is simply
: not true and varies so radically from antenna to antenna that it's
: not sound advice to give someone.

: *The simple conclusion which can be empirically demonstrated with
: *minimal effort is that a TV antenna will perform well above a discone
: *at 343 MHz, a point halfway in the gap of 216-470 MHz.

: Cheek, ANYTHING performs better than a discone antenna! If you loaded
: up your jock strap it'd work better than a discone!

: I deleted the rest of your message without reading because you've wasted
: more than enough of my time.

: I eagerly await the publishing of one of your dissertations in
: the IEEE Spectrum.........I think it'll be a long wait......

: Cheers!

: Andy

: As an asside to the discussion, Would you advise turning the 'TV being
: used for scanner' antenna 'on its side' since this sets it vertical
: rather than horizontal polarization?

Definitely. Otherwise - ignoring polarity rotation due to reflections etc,
you are going to suffer (if I remember correctly) 20+ dB of signal reduction.
If that is the case, you might as well use a rubber ducky - and not go to
all the effort of putting up that outdoor antenna.

Michael N. Daugherty (mnd@netcom.com) wrote:

: Does anyone have a mod for a Radio Shack 20-145A Base station Scanner?

For those that do not know - the common name for this scanner is the PRO-2006. There are two quick and easy mods - which anyone who can handle a screwdriver can manage.

Take out the two screws at the top back cover. Carefully slide the cover back a bit - then lift it up and out of the way. Be careful, as the speaker is mounted on the cover - and you do not want to break the speaker wires.

There are two diodes behind the 3 key. Clip them both. This will restore cellular coverage - for when congress wises up and decides to repeal their stupid anti-listening law, and will also speed up the scan rate by about 20% (30%?).

Hi Bill,

Bill Cheek (bcheek@cts.com) wrote:
: mike@dino.eng.monash.edu.au (Mike Paull) wrote:

: > In your new book (or your older ones) do you have any circuits
: >for controlling a pro-2011 from a pc compatible?

: Maybe yes, maybe no. I don't know anything right off about the 2011
: so that's the biggest stumbling block.

I would say that could be a problem! It's a fairly simplistic scanner
in terms of features and design, borrowing all it's main components
from the standard GRE parts bin. Major parts are:

CPU GRE 0530A
Audio Amp TDA 1905
IF Amp/Quad/Det TK 10420
PLL CX 7925B

Basic features; 20ch memory, 66-88mhz ; 138 - 174mhz ; 380 - 512 mhz and
no search facility.

: >In one of your previous replies you say the CD 232 is adaptable to the
: >Pro 43, although this unit does not lend itself to "2 way" interfacing.
: >Can you explain this further please?

: Sure. The PRO-2004/5/6 scanners are designed with a CPU to do one
: thing and a totally separate LCD driver chip to drive the Display
: module. The CPU has to feed serial data to the LCD module in order to
: tell it what to display. We can physically intercept that serial data
: flow; decode it; and retrieve display data for sending back to the PC.

Ok, well the Pro 2011 is one of those unfortunate scanners that has the
LCD driver built into the CPU.

: That's nice.....we call it the data acquisition mode, which stands
: apart and separate from the control mode which programs the scanner
: from an ASCII text file.....and more or less bypasses the CPU in a
: sense.

Now I can see, two modes. Programming (dump) mode via simulated keypress
or control mode via the intercepted serial data.

: There's the rub now, because all other scanners use a CPU that also
: houses the LCD Display Driver....all on a single chip. There is no
: serial data path to intercept for that data acquisition mode. No

: problem with controlling the scanner remotely, including
: AutoProgramming from an ASCII text file, but it is not possible to
: acquire display data to send back to the PC for logging and further
: processing.

: Thus, the CE-232 is capable of "full 2-way" control and data
: acquisition with the PRO-2004/5/6 and only 1-way control with all
: other scanners. Only the PRO-2004/5/6 have an accessible serial data
: path together with the requisite clock (SC), command-data (CD), and
: chip select (CS) functions that it takes for data acquisition to be
: possible by that means. Other scanners can only be programmed and
: controlled by the PC but no data acquisition.

: Clear as mud? :-)

Thankyou for taking the time to explain, everything understood.

Looks like we might have to have a go at decoding the PLL data I think.

Mike

Source record: 252040

Modification for Putting BC-220XLT In AM Reception Mode:

I have come up with a crude mod for the BC200xlt scanner to allow AM reception in the 136 to 174 range. Why would I want AM in this range you ask? well I attend several Air shows during the year and the Thunderbirds use 140 mhz area fregs. As we all know the Uniden switches to FM in this range, causeing very distorted reception (slope detection). Somebody else may have already thought of this idea (you?) but here goes. Break the AIR Trace between dual diode D31 and IC1 pin 8. Connect the center of a single pole - double throw mini switch to the trace leading back to IC1 pin 8. Connect one of the other poles to the trace leading back to D31. This is the "Normal" mode(This just restores what you have cut). Now connect the other pole to the VHI (VHF HI) line at a easy to locate point. This is the "AM" mode. What will happen now is when AM is selected the VHF and VHF air band will all be in the AM mode. UHF and others are not affected. When in the normal mode everything is just like it always was. I have done this mode over a year ago so it's still a cloudy in my memory. But it works like this: The microprocessor sends a high to Q7 to select the AIR mode, by routing the VHI signal around D31 by means of the switch the AM detector is reselected. Normaly D31 blocks out the VHI signal allowing FM in the VHF HI range. I hope my explaination of this mod is clear. It does take some delicate surgery to do. I also hope I haven't duplicated anyone elses idea.

Thought that I'd pass on something I found on a local BBS for the dedicated phreaks out there concerning the Bearcat 200 xlt:

Note: ! means "not," If a pin does not have a designation, its destination is given. Ex. "Gnd" means the pin is designated "Gnd" but "to Gnd" means the pins was unlabeled but connected to ground. This info comes from my reading the schematic from the service manual--sorry for any errors!

1 CL1 (Keypad) 33 !CS1
2 CL3 (Keypad) 34 !CS2
3 CL4 (Keypad) 35 to Gnd
4 CL5 (Keypad) 36 to Gnd
5 CL6 (Keypad) 37 to Gnd
6 to VCC 38 to Gnd
7 to VCC 39 to Gnd
8 RW1 (Keypad) 40 to Gnd
9 RW2 (Keypad) 41 !SKIP (to Gnd via R(10k)
10 RW3 (Keypad) 42 to Gnd
11 RW4 (Keypad) 43 RESET
12 to VCC 44 !TEST
13 to Gnd 45 OSC1
14 to Gnd 46 OSC2
15 to Gnd via R(unknown) 47 GND
16 !HLT 48 !BL28 SI
17 to Gnd 49 SC
18 to Gnd via R(unknown) 50 !800
19 to Gnd via R(unknown) 51 !UHF (assumed)
20 to Gnd 52 AIR
21 !BUSY 53 VHI
22 !RST 54 VLO
23 !C/D 55 n/c
24 !CS 56 SHIFT
25 VLC3 57 n/c
26 VCC 58 MUTE
27 !SCK 59 !P/OFF
28 SI 60 to VCC
29 SC 61 to VCC
30 PLLEN 62 to VCC
31 !EN1 63 LIGHT
32 !EN2 64 CL2 (assumed) (keypad)
R(unknown) values were not listed on the schematic or in the parts list.
(assumed) labels are based on the implications of other labels on the schematic.

15, 18, and 19 look like they could be interesting....
And 41 should be interesting to people who don't want their scanner to
"skip" certain frequency ranges....

OSC1 and OSC2 are the feed in for the 400mhz oscillator. This oscillator
can be replaced with a faster one to increase the scan/search speed...but
it will also decrease your light on-time... And as far as keeping the
light on all the time...one could connect a switch to the LIGHT pin and
a VCC. When off, it would function as normal. When on, the light would
go on and off with the power. Watch out for short circuits if you do
this...I fried a transistor on mine when I had a VCC to Gnd short...

Depends which Yupi you're talking about.

To receive SW broadcast (e.g. Voice of America, Deucste Wells, etc.)
then any scanner that can pick up 0.5-30 Meg is suitable.

For amateur, and other communications e.g. trans-atlantic aircraft,
then SSB (USB or LSB depends on the frequency I believe) is a
requirement so I believe only the 7100 will be suitable.

Whilst the telescopic aerial I suspect you will have is OK, a long
length of wire will give reasonable resception, though don't expect
this to be as good as a proper communications receiver.

Finally, remember that time of day will affect the frequencies used and
the parts of the world you can receive. This is also true of the
sunspot cycle, which goes in a seven year (I believe) cycle. At the
moment, we are appraoching a low point, the high being 2-3 years ago.
This means that the 11M band (25Meg) is becoming unsuitable.

Best Wishes,
Gary Clay

I own a Pro-51 and I like it (so far). Got it on sale. They aren't
easily modifed unless the date code on back is 7A4 or earilier I
think. If there is a bright orange dot (sticker) on the box, chances
are it is not one of the modifiable ones, meaning after 7A4.

Btw, 7A4 means July '94. Mine says 11A4 therefore it isn't modfiable
thru keyboard commands like they used to be.

Message-ID: <3ujkri$5os@news.sas.ab.ca>
Source record: 252062

I just recently bought a pro-43 when they were on sale, and then learned that it could not be modded. It does not have a A in the serial number but it had the date sticker of 10A4. I got courageous enough to play around inside of it, and decided to attempt the mod to unlock the cellular band by removing D4 and it worked. I am not sure if only the Canadian models will do this or not, but mine did. Hope that this helps anyone who has wanted to mod their scanner but didn't because of the date code.

Yes, mine runs hot too.

A while back I saw someone suggesting that the R7100 be run from an
external dc supply. This avoids the internal transformer which
seems to be the main source of the heat.

I have to admit that I have not tried this, but it sounds like a
good idea.

I find it useful in notching out the idle tones on link
frequencies. The UHF links used in my area to get traffic
from some satellite receivers to the dispatch center make
nifty fire repeaters, except for that nasty tone. With the
DSP on line, they can be monitored without the headache.

The common problems with the early production runs of the AR8000 were the numbers wearing off on the keypad and the BNC connector becoming loose. We had notified AOR about this and all units we are currently receiving have had the corrections made. Anyone who is having either of these problems with the radio can send it in to us for service; I assign priority to these requests and can usually get it turned around in a few days.

We had an initial problem with the EDCO interface. There are two trace cuts on the board and in some units the cuts were not complete. This problem has also since been corrected. The only other problem I've seen is breaking the solder where the ribbon cable connects to the board. The ribbon cable won't take an excessive amount of abuse, but as long as it's not bent past 90 degrees this really isn't a problem. We took some criticism on the net early on about these units, some of which was justified but some of which wasn't, but we are always glad to try to assist anyone who is experiencing any problems.

You should be able to get some feedback from this group about the AR8000's performance. I will refrain from giving you an excessively enthusiastic recommendation, but I think that by and large most people are happy with the radio.

All the best,

Steve Hennigh
Electronic Distributors

They were in Hillsboro last weekend, using 275.35 and 307.7. However the solos were on another frequency which I didn't have. I also heard activity on 263.35 and 302.15 during their orientation flights the day before the first show.

My wife and I attend as many NASCAR races as possible, and we have found that oftet drivers may change freqs. Freq lists are sold at all NASCAR races - costs a few bucks, but well, worth it. No guessing. Heck, if you're going to spend the money it takes to attend races - tickets, food, transportation etc. - what's a couple extra bucks for frequencies.

Chris,

There is a company in NJ who makes the encoders and recievers. Their name is Modulation Sciences. I've got their number at work, but not here at home. Email me if your interested. Encoders are around $5000 and the recievers are about $400 I think.

Their encoding scheme is a bi-polar NRZ (non return to zero) format. They can modulate at any of the subcarrier frequencies if you want. I have been wanting to experiment with rolling my own encoder/decoder, but have not had the time. I was talking to an RF guru about the RDS decoder chip that Signetics (and some others) has out, and he seems to think that you can use this chip at the sca frequencies even though it was designed for the RDS subcarrier. The chip's data sheets do not say this , but I think it's feasable. If that will actually work, your decoder is done. This chip takes IF in and spits clock and data out. Pretty sweet. It's only about $5 too. The RF dude said that rolling the decoder from discreets is possible, but you have to do a lot of tuning before it can go out the door. I was looking at manufacturing them in quantities of 5000, so if I can use an IC to replace several discreets I would definately go that route. Hope this helps, I'm no RF expert, and I have just enough knowledge to be dangerous. If anybody has a clear picture on SCA data transmission, let me know too.

I'm new to the scanner hobby. I would like some recommendations on which handheld scanners to buy. I'm interested in one that has good features and reflexibility for modifications. So far, I've seen the BC150, which looks nice but I doubt it is very powerful. Any recommendations on the the Radio Shack models, or the expensive AOR8000? Also, what is the legal issue on scanning cellular phone calls? I've heard that it's okay as long as one does not discuss what he or she heard to another person. Please email me or post to this group if you feel your message might help someone else. Thanks for any info.

Phong.

Tom Moorehouse <twilson3@ix.netcom.com> wrote:

>I know this probably sounds like a realy stupid question, but can
>someone explain to me what a mod is and what it does??

From the "Introduction to Scanning" FAQ:

Modifying Your Scanner

The term "mod" is often used as shorthand for |
"modification." If you are handy with a soldering iron,
you may be interested in modifying ("modding") your scanner |
to add features or enhance its performance. Be warned this
usually voids your warranty and current models are
difficult to service due to the small, delicate surface
mount components. By federal regulation, new scanner
models cannot be easily modified to tune the cellular phone
bands.

The term "mod" has been narrowly used by some people to |
mean a change which permits a scanner to receive cellular |
phone frequencies. This definition is far too restrictive |
as there are several ways one could modify a scanner, e.g., |
changes to improve audio quality, adding an S-meter, |
expanding the number of channels, changing the earphone |
jack to accept stereo headphones, etc. |

Modification article files can be copied from several ftp
sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people
without FTP access. You can request a list of scanner
modifications by sending electronic mail with the words GET
INDEX.TXT to FTPmail@exchange.tlh.fl.us |

If you cannot find files describing modifications to a |
particular scanner, it's probably because nobody bothered |
to devise a modification, or more likely, nobody has taken |
the time to document their modification. |

Modification articles posted on Usenet seem to have a life |
of their own. Frequently, they are plagiarized from the |
Internet and compiled by book, CDROM, and magazine |
publishers, sometimes reworded, then sold. Hobbyists then |
copy the modifications from the books, CDROMs, and |
magazines back onto the Internet or BBSs (bulletin board |
systems)! |

Grove Enterprises and other companies advertise a |
modification for fee service.

I bought one when they first came out and returned it many times because
of this heat problem. If left on for days at a time, it would get so hot
that the receiver would drift and become less sensitive. ICOM claimed
they could not find a problem with it. We pissed around with them for
a while and finally gave up and ran it with 12 volts. The radio works
perfectly running on 12 volts.

Oddly enough, it's predecessor had the same problem, the R7000. I had one of these for years until I sold it to raise funds for the R7100. I had to run it off of 12 volts as well to keep it cool.

Bill

If this is what your after, try 150.100 for metro air ambulance (Min of Health). This is the provincial common ambulance freq. Listen for the callsign "799". For Airborn traffic listen to 150.670 for 680 News/CHFI FM98, also 153.35 for Chum/Chum FM, and 162.33 for CFRB/Mix99.9. Note, the airborne traffic here in Toronto is NOT Helicopter...its all fixed wing aircraft since helicopters are EXPENSIVE! Only the air ambulances are actually helicopters.

One of my freq book lists the following for the Blue Angles (Navy):
141.560/ 142.000/ 143.000/ 251.600/ 263.350/ 275.350/ 302.100/ 307.700/
345.900/ 360.400

Some other freqs allocated for air show use are:
122.750/ 122.850/ 122.900/ 122.925/ 123.100/ 151.625/ 154.540/ 154.570/
464.500/ 464.575

Hopefully this helps!!!

I've gotten crew chatter for a couple of other big name acts
on these frequencies, so don't write them off. The parking
and security people use 'em too.

Sometimes the wireless stage electronics can be picked up
quite a distance away. The pro stuff tends to be wideband FM
in the VHF and UHF TV bands. Some wireless instruments can
be found in the 900s too.

There are no freqs used only for severe weather alerts. If you don't
want to listen to the continous broadcasts you will need one of the
weather alert radios that is turned on automatically by the weather
service anytime they transmit a severe weather alert.

Radio Shack has several weather alert radios. Some scanners have the
weather alert feature, too.

>Thanks for the info.

>So, anybody know the frequency of NASA Select? (audio portion)

Yes. NASA Select TV programming is received by satellite dish. So you will need one of the big ugly backyard satelllite tv dish systems (not the new small dish systems). It may also be availble on your local cable system.

NASA Select is on Spacenet 2, Transponder--5, Channel--9, located at 69 degrees west longitude, at a frequency of 3880.0 MHz (C-band) with horizontal polarization (audio on 6.8 MHz).

1328. Feed back on scanner from CB

Newsgroup: rec.radio.scanner
Date: 1995-07-20 00:00:00 UTC
From: Uebe0002@maroon.tc.umn.edu
Message-ID: <DBzMuF.IGq@news.cis.umn.edu>
Source record: 251948

When ever I use my CB(Uniden 520xl) and my scanner(BC2500xlt) together
in my car and transmit I get feed back through the scanner. Is there a way to
isolate either the scanner or CB so I won't have this problem. I have my CB hard
wired into my car, while my scanner runs of its rechargeable batteries.
Initially, I was using the CB antenna for both units for improved clarity
over the CB and police frequencies, but then I switched back to using
the scanner's rubber ducky antenna. However, in the latter case the
problem was not solved. Also, is there any problems associated with
running both units off the same antenna, besides loss of some frequency
range in the scanner. Would trying different coax cable solve my problem?
Or should I try some sort of low pass filter? Any ideas or comments would be
appreciated. Thanks.

Date: 1995-07-20 00:00:00 UTC
From: Kevin Kibbe <kkibbe@frontier.canrem.com>
Message-ID: <200795.0124061819.n@frontier.canrem.com>
Source record: 251951

Hi, I have bought a pro 2001 and I have noticed something that seams to indicated that it has an extra bank of channels. One day I turned it on and all the frequencies that I programed in were gone but a new set was in place. The "new" freqs were not random garbage.

Could someone tell me if the 2001 had a mod that gave it more channels than its normal 16? And if so how do I reach them.

Any other information on the 2001 would also be nice, and yes I do want a better scanner, just a matter of time...

Kevin

>IF Amp/Quad/Det TK 10420
>PLL CX 7925B

Yeah, that doesn't help in terms of needful information relative to controlling the scanner by a PC. Control is possible in only one or two ways: intercept and replace the PLL data; or use keyboard emulation techniques.

>Ok, well the Pro 2011 is one of those unfortunate scanners that has the
>LCD driver built into the CPU.

Yes, the only scanners that have separate CPU and LCD Display Driver chips are the PRO-2004, PRO-2005, and PRO-2006.

>: That's nice.....we call it the data acquisition mode, which stands
>: apart and separate from the control mode which programs the scanner
>: from an ASCII text file.....and more or less bypasses the CPU in a
>: sense.

>Now I can see, two modes. Programming (dump) mode via simulated keypress
>or control mode via the intercepted serial data.

Nooooo. Programming and control are one and the same. Control goes one step farther in the sense that you can -=control=- the scanner from the PC keyboard in addition to programming, but both are "control". Data Acquisition mode is intercepting and utilizing the Display data in the scanner.....channel #, frequency, mode, functions, etc. The two are distinctly different animals: control and data acquisition.

>Thankyou for taking the time to explain, everything understood.
>Looks like we might have to have a go at decoding the PLL data I think.

For the PRO-2011? You've got to be kidding? Unless it's a purely personal fun project, you're going to invest a lot of time and resources into a non-paying proposition. For personal fun and enrichment, that's one thing. But don't hope to derive any gain otherwise. No one I know of uses a PRO-2011. And the people who do are largely out of touch with the real world......meaning they don't subscribe to magazines and don't romp around in cybermedia. They're out of touch and can't be reached, you see?

Largely victims of a predator Radio Shack salesperson.....

jaynorth <mail@direct.ca> wrote:

>Geeze Bill, give it a rest. I was interested in purchasing your book but
>after all the crap I've seen you write here I will pass it up.

That will be fine. This is America, and you have the right to pass.

>Sometimes its better not to have the last word.

How are you qualified to elucidate the terms and conditions? And
"sometimes" implies "sometimes not". You didn't explain the
difference and I opted for the converse....equally valid, mind you.

>Give it a rest. Don't be such a whiner, if someone else has an opinion about
>you, so be it. Sometimes it takes more maturity to ignore an issue rather than
>to spring to the attack.

Yes. Sometimes. And sometimes NOT. Again, what are your
qualifications to espouse one over the other? Are you a sub-deity,
per chance? A preacher? A moralist? What?

In any event, there were some serious charges driveled against me at a
time when it was thought I wasn't here. I thought it best to reply to
them and to assert my presence. Had I not done so, others might well
have thought I had something to hide. Perhaps many more than those
who share your one-sided perspective. But it does not matter.

No matter at all. I am not here to sell. And your "leverage" only
pleases me all the more, because I love FREEDOM in any form. You
exercised yours, and that's what FREEDOM is all about. Either way, we
make choices....and some are right and others are wrong. You chose
one way and now you will gain or lose......makes me no never mind
aside from the pleasure of seeing FREEDOM in action, even if it is not
at first glance, in my favor. I do not operate like a lot of
slimeballs in a manner to gain favor. They'll knife you in the back
later. Me.....I'll do it where you can watch. No skeletons in my
closet, pal.

Lastly, it just makes me orgasmic to have an opportunity to prove that
I am not here to make sales. In fact, I do not trade my foundations
for a slimey sale. First and foremost, I am a radioist. I write
books and other things on the subject as an incidental aspect of my
love for radio. But it really is incidental, you see..... and if you
choose not to buy as a way of exterting some obscure force on me, well
pal.....heh heh heh.....all I can further say is that I am not subject
to intimidation and sacrifice of my values in real Life and I am not

going to be subject to them here. You picked the wrong dude upon which to flex your consumer muscle. It did not have the intended effect. Instead, it labeled you as "persona non grata" in MY books.

So you see....we BOTH exercised our freedom....and we both are happy now, no? I am. :-)

Andrew, that is not particularly accurate. The 2000-yd nautical mile was established a long time ago and it contains definite inaccuracies now with respect to being equal to 1-minute of arc. There is some controversy, I suppose, over the exacty number. But 1-nm=1-arc min is not the number required for precision nowadays.

The Clarke Speroid of 1866 is a good model, used by the US Geological Survy until recent times, but I understand there is an even more accurate model now. I don't have all the deedback on it yet.

Not sure but try 476.7375.

By the way, you are talking about the 4th division. The 3rd division
is Midtown North, Midtown South and the 17th.

1st div - 1/5/7/9
2nd div - 6/10/13
3rd div - mts/mtn/17
4th div - 19/20/24/cpp
I get lost beyond that though....

Also 854.9875 is used for Brooklyn South & Staten Island dispatch. It
is always on this channel - i.e. it is not part of the trunked system.

Same thing with 855.4875 used for Manhattan North dispatch.

Fort Worth, Tarrant County, and several of the suburban cities and other municipal and public safety agencies (like MedStar) have all gone to the 800 MHz trunking system that was installed a while ago. Dallas picked up some of the 460MHz frequencies, evidentally, as did some of the other agencies outside Tarrant County.

The earlier scanners RS, Bearcat, Uniden all had default or factory settings
sometimes referred as TEST FREQUENCIES. These will usually show up if you
yank out the backup memory battery. I suspect that your set the battery is
either dead, or missing. Look for a little door held in place with a phillips
head screw. If my memory is right inside it should live a 9 Volt battery.

Cross-posted to: rec.radio.noncomm,rec.radio.amateur.homebrew,rec.radio.scanner,rec.radio.amateur.equipment

Does anyone have any knowledge of converting an old TV to a (lousy?)
Spectrum Analyzer ?

My idea is to hook the vertical yoke to the speaker and the horizontal
ramp voltage to the tuner (with a pot or voltage divider between them for
some control).

With a marker I should just be able to change channels to move around the
spectrum and get a 'picture' of it. TV's have decent freq. range also ...
Not a Tektronix $100,000 setup but I should 'see' 'something'.

B/W TV's are cheap enough that I'm willing to butcher one ...
It would be helpful if anyone had tried this before or better yet knew of
an obtainable article on doing this...

Any tips would be appreciated or have I missed some intricacies of
television design that would prevent this from being possible ?

Don't laugh too hard as I only intend to cut a couple of wires and it
should be easy to restore it if need be ;>

jwayda@netcom.com (Jim Wayda) wrote:

>I understand that Space Shuttle audio is rebroadcast on HF. Could someone
>please post these frequencies?

Retransmission of shuttle air-to-ground audio from WA3NAN may be heard
on the following frequencies:

Frequency Mode
(MHz)
3.860 LSB
7.185 LSB
14.295 USB
21.395 USB
28.650 USB

Being able to hear the shuttle retransmissions on WA3NAN is dependent
upon several criteria. You also need to know the following:

A. WA3NAN is on the air only while the shuttle astronauts are awake
(assuming the mission is not of the 24 hour variety). These times vary
with each mission and are sometimes shifted while the mission is in
progress. This is being done on the current mission. The crew's daily
sleep/awake periods are listed in the mission's NASA Select TV
schedule.

B. WA3NAN depends upon volunteer operators to keep it on the air. They
have a limited pool of operators available during any single mission.
The most difficult days and nights to schedule are usually on the
weekends.

C. If there are thunderstorms or other inclement weather currently in
the area or predicted, WA3NAN will likely be off the air until such
weather has passed.

D. Propagation. Propagation. Propagation.

Roger

>

Hi, The mountain is a big part of your problem. The lower the frequency the more a radio wave can refract and 'bend' downwards as it passes over an obstruction. I know because I have the same problem with New York City! I get alot of the 150-160 stuff fine but am virtually deaf in 460 range and forget 800. In any case it sounds like your only hope may be a high gain directional beam or something. But it the waves aint there its gonna be tough.

Good Luck

A fellow mountain hater (as far as scanning goes)

Frank.

1353. mauve box- question

Newsgroup: rec.radio.scanner
Date: 1995-07-20 00:00:00 UTC
From: drchem@iastate.edu
Message-ID: <drchem.806213776@du81-01.cc.iastate.edu>
Source record: 252101

Below are instructions for building a "mauve box", which supposedly is able to pull in phone conversations. The instructions aren't particularly clear, at least to me, and my question is: do you think this gadget works? Thanx.

```
/~~~~~~~~~~~~~~~~~~~~~~~~\
| How to Build Your Own |
| |
| |\ /| _ __ |
| | \/ | |_| | | | | |__ |
| | | | | |_| \/ |__ |
| __ |
| | \ _ |
| |__/ / \ \_/ |
| | \ \_/ / \ |
| |__/ / |
| _________/ |
| |
\_________________________/
~~~~~~~~~~~~~~~~~~~~~~~~~
```

Please bear with me, as the construction of this box will seem rather silly. This box was found in a construction site. Or rather, it found us at a construction site. We were using a $5 Radio Shack phone out of a semi-completed office building. One afternoon during a holiday, and immediately following a storm, we found our bus in shambles. To our suprise, we also found that one of the phone connections we were tapping had been draped through a murky puddle. The fact that suprised us even more was that this line still worked and now posessed some great capibilities.

Materials:

2 tupperware or similar 8oz contianers
1 small bag earth (dirt) (12oz)
1 pint water
2 lantern batteries
1 nine volt battery
1 battery clip
2 SPST switches
4 ounces of iron shavings
2 polar magnets
5 feet wire
1 set soldering equipment

This is the part you won't believe. Take the tupperware containers, and fill them with a mixture of the earth and the iron shavings. Make sure that the mixture is well done. (*NOTE* for best results, use the sand in fine ash trays.) Cut the cut the red and green wires and splice the switches into them. From the switches, solder wire to the magnets. Connect the red to the + (positive) side of one magnet, and the green to the - (negative) side of the second magnet. From the other poles of the magnet, solder wires the battery & clip. Make sure the + (positive) and - (negative) are correct. Set the nine-volt battery between the two tupperware containers and place the battery end of the two magnets into the tupperware. Now connect wire to the two poles of the lantern battery, and place them in the same containers as the poles of the magnets/9-volt battery. You are almost done. Finally, add just enough water to the two pots, and let them sit in the sun and bake like bricks. at this point, you have a MAUVE BOX.

Explaning and Using What You Have:

The red and green wires have been places into a magnetic field which is being charged continually be a lantern battery. (It is necessary to change this battery every one to one and a half months.) This will literaly pull in the nearest phone conversatiion. (Don't try this in a big apartment or dorm.) When the 9-volt battery is connected, this will now create enough current for the poles of the magnets to reverse themselves (perhaps you're seen Mr. Wizard do this. It's just like with the soap). At this point, you have a phone transmitting to one (if not more) of the nearest phones. (Again, if you're in a dorm, don't try this.) I suppose this just accomplishes what a tap would do, but with a MAUVE BOX, your fingerprints never will show on a terminal or on someones telephone lines.

Notes and Addendum:

This will only work with a touch-tone phone connected to a phone line. When the switches are pulled, it's off your line and into the air.

:low?! I am keeping a copy of this message in a macro so I could just
:keep responding to all the inevitable letters I will be receiving.
:
:Peace!!!!!

Oh dear. You try to correct the error you made and in doing so you
make another clasic blunder.
The reason you got caught up in the dieing child scam is because
you are too imature to be wary of such things. That is the same
reason why you have not grown out of saying ass when you really
mean arse. I know you got it from other children at school but
they only said it because they were either too afraid to say arse
or they just thought it was cool to mispronounce the word.

One day you will learn.

>Has anyone got an AR 8000 and would like to tell us about it.
>Does it do 500kHz to 1900 MHz without gaps?

Yes (100 kHz to 1950 MHz actually)

>What does connecting it to a PC do.
>
There is a very long list of commands supported. The important
difference with the AR8000 (and AR2700) over previous generations
of scanners is that it is now possible to program scans and
searches to run locally within the radio at very high speed. This
is an advance over the Icom 7100 which has very slow tuning by
comparison.

It is also possible to modify most of the radio's parameters such
as dwell times, pass frequencies and even the internal bandplan.

The list of commands is geven in the CU8232 interface manual and is
unfortunately too long to transcribe and post here.

Several commercial software packages are now comming on the
market. Look out for AOR PC-MANAGER for Windows which is entering
beta testing at the moment.

If you have WWW, try
http://www.cpl.uiuc.edu/~tpeckish/appendix.html which contains a
lot of information on the EEPROM contents. It also contains links
to other WWW pages such as Victor Healey's.

It may not be illegal but if you are threatened by a large corporation
with legal action there is little practical difference than if you
were threatened with a gun. Unless you have a LOT of spare cash you
are chum for the Land Sharks. The OJ nonsense should make it clear that
right, wrong and the law have no place in the legal system and it is
not a patch on major law suits. The reality is if you are threatened
by lawyers all you can do is crouch down and hope they go away.

1374. Pro43 Keycode Mods

Yes, it is extremely easy to do. Call Radio Shack in Vancouver aand ask
for Jonathan. Try to get a 43 without an "A" in the serial number.

Good luck,

Jim

The 43 is considered one of the best scanners ever made. It is much
better than the 51.

Yes it can. Depends on which version you get. In the U.S. the police
agencies can buy one without the gaps. The regular citizen gets one
where the cell band is blocked.

Several things, depends on what program you use. You can log freq. hits
when scanning, reprogram your radio, store several sets of programming
so that you don't have to reprogram your radio by keying in new freqs
everytime you go someplace, or even block or unblock freqs if you want...

> and I still get nothing)

Yeah, the duckie sucks for CB. I tried to use it on a road trip,
and I didn't get anything unless I was with about 100 feet of
the transmitter. So, I bout a mag mount scanner ant. that was
supposed to go from 25-1300. Now I could hear CB within about
a 1/2mile l-o-s only. I then, just for the hell of it, connected
an adaptor to my regular CB ant so I could try it. Voila! Now
I could get the CB stuff as far away as my regular CB unit, which
doesn't *scan* the CB band. It also works pretty good in the
400 and 800 bands, which for right now, is pretty much all I listen
to right now...

When I want to listen to CB at home, I just pull the mag mount CB
antenna out of the car and bring it into the house. Works pretty
good!

1384. Mod to 43 modifications FAQ

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: gdallal@world.std.com
Message-ID: <DC1JrB.FzK@world.std.com>
Source record: 251832

This paragraph includes updated information at the end. I didn't want to post the whole FAQ again so soon.

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). There have been *no* reports of a modifiable 3A4 unit. However, there have been reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number. So, for the moment, the serial number is the most accurate way of determining a unit's modifiability.

Probably the best package available today is the OptoScan 456 (an add-on board for the RS PRO2005/2006 scanner) which can be controlled by a Mac or PC. Several programs are available for the OptoScan, "Wave" runs on a Mac, ScanStar and others on Dos, and Radio Managers and others on Windows. Demos of most of these programs are available on AOL or CIS.

Also, if you have a RS PRO2035, OptoScan makes an "OS535" that works on this as well.

Other radios that can be computer controlled include the Icom R7000 or R7100, and the AOR8000.

Message-ID: <9507202100203333@solis.sbay.org>
Source record: 251839

I have had an AR8000 for a few months now. It has a lot of
features. If I had to rank them, they would be:
1) alpha tag: Alphanumerics are a must for a scanner that
holds a 1000 frequencies.
2) memory banks: They are a nice size (50), but it gets
even better in that they can be linked. You
can group frequencies together, such as
cordless phones (for educational purposes only)
in a bank and fill the rest of the bank with
shortwave. The scanner can be told to scan
only one type of signal (i.e. NFM). This allows
you to use each bank completely. Linking comes
in handy in that you can group each type of
service in an individual bank (FBI in one, DEA in
another) but scan them both.
3) pass frequencies: Each scanbank can hold a number of freqs
to be skipped, such as cellular control channels
(for educational purposes only)
4) select search: Take your favorite freqs in different banks,
tag them for "select search", and you can just
scan those frequencies.
5) data port: How else can you program 1000 channels with alpha
and still have a life? I have not figured out
which model is best and then only have a few
hundred freqs in mine.
6) short wave: It works pretty well with just a whip. A long
wire is just to much for me, but then again I'm
ten miles from KFS. From the SF bay area, I can
pick up Radio Havana, RFPI, and an occasional
EAM or two.
7) step size: Put it in expert, and do just about any step.
Virtually everything in this radio is programable.

Now the negatives:

1) battery life: This radio eats batteries. Buy nicads and
carry spares. I use an external charger to keep
the heat generated in the radio to a minimum.
2) intermod: It's no AR3000A. Put the AR8000 on an external
ant (even a ham mobile) and you may hear pagers.
Two meter ham repeaters can be heard clearly when
scanning the ATF freqs. [Or do BATF agents say
"I'm destinated"].
3) floating birdies: This really bugs me. Birdies appear on
freqs that were once clear. Then they fade away. A

major pain! You have to lock out that channel for
a while then remember to add it again later. This
is easily my biggest complaint.
4) size: No covert scanning with this radio unless you wear
a large jacket.
5) scan quit: A scanner should be designed so that while scanning
if you hit ANY button, it should remain on the
freq you were scanning. On the AR8000, if you are
scanning and get a signal that you want to stay on, hit
"ent" and nothing else.

(I just got Batt Err on the 8000, stand by for diaper change)

6) airphone scanning: Only the AR3000A does this right. You need
very odd offsets and steps to do this. The AR8000
will scan airphone, but you must scan lots of wrong
frequencies. (For educational purposes only.)
7) data interface: Just who the hell thought this non-standard
cable would be a good interface. You have to take
the battery cover off just to get to it. Any technical
person could build this interface with a MAX232 type
chip, but you can't buy the damn connector. OPTO is
modifying the radio with what looks like a stereo
jack, so at least you can leave the battery cover on.
8) headphone output: It's nice and recessed. Only one stereo to
mono converter will it in the hole (Sony pc-236hg). The
amplifier noise is very evident when headphones are used.
9) knobs: The rubber like knobs are just too soft. I've already
had to swap "squelch" with "power" as the knob would slip
off "power" when turning it on.
10) 800MHZ reception: Palo Alto has something like a single frequency
cell phone (860.7125 with 45MHz offset). It seems the
AR8000 needs the squelch turned down to hold this signal
even though it is quite strong.

Should you buy it? At the moment, there is nothing comparable.
Could it be better? You bet.

1392. Vancouver BC

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: fj223@cleveland.Freenet.Edu
Message-ID: <3uni73$fin@usenet.INS.CWRU.Edu>
Source record: 251840

I'm planning a trip to Vancouver in August and would greatly appreciate any help in collecting a short 'hot list' of the most important frequencies in use around that area. I haven't got a guide of frequencies for the city, so I'm hoping someone out there can share what they have with this newsgroup or directly with me through email.

Thanks in advance,
Alasdair

1393. Voice+MDT data trunked systems

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I live in Southern California and used to enjoy monitoring the Riverside Count Sheriff's Department. I had not monitored them for several years and decided to give it a try tonight. I found that they had moved to a trunked system with seven frequencies per region.

Uusally monitoring a trunked system is very easy. Not so for this one!!

All of the channels alternate between voice and MDT data. It is not possible to monitor this system. They might as well have went to encrypted digital transmission.

Scan while you can,

jim

1394. PRO-43 vs PRO-2006

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: ric.topp@nccbbs.com
Message-ID: <8ADA3DD.000B006763.uuout@nccbbs.com>
Source record: 251842

I just picked up a used 2006 and was surprised to find that the 2006 is less sensitive than 43.

I put them side by side, same antenna (rubber ducky) and started scanning the aircraft frequencies. The 43 was picking up much more than the 2006 even with the squelch all the way down.

I don't have the spec's on either radio but I'm curious if this makes sense to you experts!

Thanks in advance...Ric

Subject: Help

>>Need Pro-2021 Complete Cell Mod.

From the Mods database at ATTENTION to Details BBS, 909-681-6221:

overview: the pro2021 is a 200 channel scanner, mode is implied by
frequency, missing the 220 ham band, 800+ cell fone/ISM band, the
170ish thru 380ish military? air band...
sold for about $200 from radio shack, first on special in 1986 time
frame.
bands which the cpu will honor may be excluded by the presence of
diodes near C151 (on silkscreen) top view, left end, rear.
in order from left starting with D44:
D44 - 'U2' - 810-960 MHz Mode: FM Step: 12.5 kHz (installed - cell fone)
D?? - 'U1' - 380-512 MHz Mode: FM Step: 12.5 kHz
D?? - 'Hi' - 138-174 MHz Mode: FM Step: 5.0 kHz
D?? - 'Ar' - 108-136 MHz Mode: AM Step: 25.0 kHz
D45 - 'Mi' - 68- 88 MHz Mode: FM Step: 5.0 kHz (installed - TV ch2-4)
D?? - 'Lo' - 30- 54 MHz Mode: FM Step: 5.0 kHz
further: when the cpu selects a frequency, IC8 (a shift register) is
used to enable the rf front end for that band. IC8 is near center,
about 1.5 inches from front, thru-hole mounted on top. the outputs
of ic8 associated with D44 and D45 are not connected to anything.
R112 leads from pin 4 of ic8 to base of q10, and when the output
at pin 4 is active (low) enables VHF LO band reception.
Pin 5 of ic8 is active for "Mi" or "VHF-Mid" band recption.
another (10K) resistor may be connected from pin 5 to the rf-enable
end of r112. this will enable the lo/rf for 68-88.
this mod is incomplete, and any "scanner men" are invited to
enter this discussion.

pin 13 is associated with the 810-960 MHz band, and similar modification
of adding a 10K resistor from pin 13 to the rf end of r113 should
enable that rf front end.

note: search mode does not function with either of these mods, so
i'm probably missing something, but direct (manual) frequency entry
of the 2nd harmonic of the 440 MHz ham band coupled with the use of
a 440 HT who's 2nd harmonic is about 50 - 100 dB below carrier result
in a full quieting signal at 5 watts at a distance of about 2 feet.

so: have we stimulated anyone who knows stuff about modifying scanners
to join in and help us 2021 owners out? if so, that would be great.

```
btw: cycle the power after clipping diodes, the cpu seems to sample the
diode array at power up only. reset is not necessary.

Bill, do you mean that you are not interested in making sales only on rec.radio.scanner or in general? You plug your products on your BBS ("Home of the Hertizian Interface," I think you call it) and in your newsletter. In fact, in your most recent issue of WSR, you urge readers to renew their subscriptions at the old price, before the new (increased) price takes effect. That would suggest more than a passing interest in making "slimey sales."

Hi all.

I am new to the scanner world, in fact, I haven't even got on
yet. I am receiving harmonics of cordless phones on 1611-1800KHz, but
would like to get hold of band plans etc and info on what I would be
likely to receive if and when I get a scanner.

For instance, what are the REAL frequencies of cordless and
mobile phones? Where are the satellites? What are UK tv frequencies?

If there is a FAQ or anyone has this kind of info, could you
either point me in the right direction or please send it to my email
address. I would be grateful for any info whatsoever. Thank you so much.

Brad

1408. 225-400 MHz Is anything out there?

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <21JUL95.17084511@shrsys.hslc.org>
Source record: 251856

I recently recieved a Pro2006 and have been searching the 225-400 range
with no success. This is the first time i've been able to look in that
area as my other two scanners don't cover this range. However, I've yet
to hear anything at all!(Except for a NYC radio station 97.1 FM at 328.275
which I attributed to imaging)I've searched in the NFM and the AM mode but still nothing.
Is this frequency range mostly for use by military aircraft and
would I have to live near an airbase to hear much? Also, are handheld
scanners that feature this range configured for NFM or AM mode and does
it matter? Any thoughts and help would be appreciated.
Thanks
Phil

1409. NYPD to equip all cars with MDTs

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: hglassma@daniel.drew.edu
Message-ID: <1995Jul21.135119.123189@daniel>
Source record: 251857

The NYPD recently made a $20 million dollar deal with Motorola Israel for thousands of MDTs to be installed in NYPD radio cars.

Currently very few NYPD radio cars have MDTs, but with this deal soon all cars will be so equipped.

Once complete, all NYC emergency services will have MDTs in their vehicles as EMS & FDNY have been using MDTs for some time now.

JB> and if so ... what are these keystrokes??

The Radio Shack employee was mistaken.
The PRO-43 is made by GRE. The scanner models that used a keyboard input
were made by Uniden.
Uniden scanners use a keyboard input to load test frequencies into certain
memory channels.
GRE scanners require you to load the frequencies used in testing and
alignment manually.
That's confusing...
Uniden scanners will self-load the test frequencies if you press a certain
sequence of keys, while GRE scanners require you to enter each frequency the
usual way. That looks better...
Anyway, the PRO-43 can't be done that way.

D>Can anyone reccomend a good scanner antanna. I live 30 miles east of
D>Chattanooga, Tn. and cannot receive them. Thare is a small mountain
D>between us and them. They operate on UHF. I have an outside antanna.
D>It is from Radio Shack. Its the one for around $30.00. I have it 30
D>feet in the air with RG-8 running about 50 feet. I had considered
D>buying one of the scanner amplifiers from Scanner World, but have
D>heard different responses on them. Can anyone give me some feedback on
D>them. I can pick up VHF up to 50 to 60 miles off. I want to monitor
D>Chattanooga though.

You may find it difficult to pick up Chattanooga no matter what you do
unless you live right on the mountain, in which case you could run a
LONG wire to your antenna on the top of the mountain. There are special
and somewhat expensive transmission lines for this sort of thing.

You might consider any of the following. Move the antenna up or down
while monitoring, to see if height up or down makes a difference. Move
an antenna around on your property while listening. Aim it apparently
away from the station hoping to get a bounce off another small mountain.
Some times what would normally be meaningless differences can make a big
difference if you have other surrounding mountains or hills or valleys
that might guide the signal to you.

Things don't always work as one expects. While fixing a tv a couple of
days ago, I picked up a station on Channel 3 in Arizona on audio, fading
in and out with another station of undetermined location. And this from
Salem, Oregon 1000 miles away.

Are you talking 800 Mhz or 460 Mhz anyway? Picking up Portland 40 miles
away on UHF (460 Mhz) is quite common here, since the terrain is flat.
But I think it is much less likely to pick up their new 800 Mhz setup.
Also if it is 800 Mhz, you are going to have to look very carefully at
transmission line, amplifier, etc, since losses are very high in
standard transmission lines at 800 Mhz. Actually new twinlead has much
lower losses (theoretically at least) at high frequencies than coax, but
it is mostly unused for reasons I have never heard explained.

My TVR7000 ATV unit for my Icom R7000 has stopped working. The IF out of the receiver looks good so I need to look at the ATV Unit itself. The problem is that I cannot find my schematic for the TVR7000. If you have this schematic and would be willing to make a copy for me I would be greatful. I don't want to go inside this sucker without it. You can email me directly if you can help.

Thanks,

Ray WA1WZF

1427. Re: Need Bearcat 101 information

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: 72717.733@compuserve.com
Message-ID: <3umlmn$4eb@dub-news-svc-2.compuserve.com>
Source record: 251970
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

The Bearcat 101 was my first scanner. Originally, it cost more than my pro2006. I still have it and the manual. I think I captured the essence of what you need to know to get the scanner programmed and working.

Programming Bearcat 101

When the ready switch is pushed down, the 16 channel switches are changed from their normal lock out function to become data
entry switches. When the enter switch is actuated, an automatic cycle begins which erases any previous data in the memory for
that channel and enters the new data then set up by the 16 switches.

Move ready switch down.
Move all 16 switches down.
Manually step channel indicator to channel the number to be programmed.
Set the switches from the formula below in the UP position.
Move the momentary enter switch down and release.
The indicator light will go out for about 1 second.
Repeat the procedure for each channel being programmed.
Turn the ready switch up when finished.
The channel switches now function as channel lockout switches.
For frequencies not listed in the look-up table.

How to calculate switch positions from frequency.

Low-Band: (30-50MHz)
To determine the switch settings for a LOW-BAND frequency:
A. Multiply the frequency by 200 and round off to the nearest whole number.
B. Subtract the number obtained in step A from 10340. Call the result "M."
C. Next we must mark the numbers shown below which will add up to exactly M. This is easily done by the following step-by-step procedure:
1. Place an "X" in the square corresponding to the largest number which is less than or equal to M.

The graphic in the manual has a 3 row grid. The first row has the 4096, 2048, 1024 ... numbers. The center row is blank. The third row has 1, 2, 3 ...

4096=1 2048=2 1024=3 512=4 256=5 128=6 64=7 32=8 16=9 8=10 4=11 2=12 1=13.

14, 15 & 16 are blank

2. Subtract the number corresponding to this column from M .
3. Repeat steps 1 and 2 until M = 0.
4. To check the program, add all of the numbers marked by an X. The sum should equal M.
D. Place an X in columns 14 & 15.
E. If rescan delay is desired on this channel, place an X in column 16.
F. The Columns with X's denote channel switches to be placed in the UP position. The columns without an X denote channel switches to be placed in the DOWN position.

High-Band: (146-174MHz)
To determine the switch settings for a HIGH-BAND frequency:
A. Multiply the frequency by 200 and round off to the nearest whole number.
3. Subtract the number obtained in step A from 36940. Call the result "M."
Place an X in column 15
If rescan delay is desired on this channel, place an X in column 16.

U & T Bands: (416-512MHz)
To determine the switch settings for U and T BAND frequencies:
A. Multiply the frequency by 80 and round off to the nearest whole number.
Subtract the number obtain(l in step A from 40964. Call the result "M."
Place an X in column 14.

E. If rescan delay is desired on this channel, place an X in column 16.

EXAMPLE: To program a LOW BAND frequency of 40.000MHz:
A. 40 x 200 = 8000
B. 10340-8000 = 2340 = M

Sw Check
M=2340 2048
-2048 2 256
292 32
- 256 5 + 4
36 2340 = M
-32 8
4
- 4 11
0

Switches up would be 2, 5, 8, 11, 14, 15

1429. Uniden BC-9000XLT design changes?

Newsgroup: rec.radio.scanner
Date: 1995-07-21 00:00:00 UTC
From: drice@imap1.asu.edu
Message-ID: <3un0lo$q85@news.asu.edu>
Source record: 251972

I've noticed that the BC-9000XLT that I have allows alphanumeric programming on all 500 channels, despite the fact that the manual says that only the first 250 channels can be programmed with alpha characters. I'm assuming that this means that there has been some re-designing done since the first BC-9000's were shipped.

My question, though, relates to the backlight in the (apparently) "new" BC-9000. I've noticed that when the backlight is on, the top of the case above the display gets warm, especially the areas near the edge of the display. I know that the origical BC-9000's used an electroluminescent panel to backlight their displays.

Do electroluminescent panels get warm when they are on, or has Uniden switched to another form of backlighting for the display? I want this scanner to last until Project 25 comes to pass, and with the lighting conditions in my listening post, a working backlight is important. I have been keeping it off as much as possible and only using it on the "dim" setting, in an effort to maximize the life of the EL panel, but if this newer design does not use an EL panel, I'd like to know, so I can keep the backlight on. I also want to have the backlight on because the LEDs are shut off when the backlight is off, and this makes it hard to keep track of scanner modes and settings.

I had posted an article earlier inquiring as to the approximate lifetime of an electroluminescent panel, but I got no reponses, so I don't know if I should even be worrying about this. If anyone knows anything about the backlight in the 500-channel alpha programmable version of the BC-9000, please let me know.

I've got an "as-new" PRO-51 for sale. It is in the
original box with manual, antenna, etc. and IS
cellular capable (date code 11A3). Barely used,
you will not be disappointed.

I am including a new set of Renewal batteries and
an unused Renewal charger.

I know that you can get a new one at RS for $249,
but any with a date code of 8A4 or later can not
be programmed for cellular frequencies.

Make an offer.

: Aha, so all that money spent on the drug problem is really being spent on
: something else? Interesting theory. I can understand why somebody needs
: to keep up with what the police are up to.

Let's face it, the "war on drugs" hasn't even made a dent in drug use, and has made rehabilitation extremely hard to get, as well as costing us millions to keep non-violent criminals (like deadheads) in prison. And everyone knows how much prison rehabilitates people (like not at all!). It also leads to mass corruption, as well as too many people killed by law enforcement, and unregulated drug strengths leading to overdoses. Oh, but you believe the partnership for a drug free America, and DARE, and all those other propoganda groups, you go right ahead and ignore facts like students who had DARE had a statistically significant higher rate of drug use than non DARE students. You go ahead and ignore where all the money *from* the drug trade is funneled to. If you honestly have never heard accusations such as his before, you better do some research. It's all a facade. It doesn't actually do anything to help citizens. It is completely inaffective. It merely drains your wallets.

Dr> I was wondering what the approximate lifespan is for an
Dr> electroluminescent panel like the one used in the BC-9000XLT is. Is
Dr> the lifespan increased by operating it in the "dim" mode? (Obviously,
Dr> keeping it off increases the lifespan...) Can the EL panel be
Dr> replaced when it finally does stop working, or would that involve
Dr> installing a new LCD display? Any info is appreciated.

David-I thought the 9000 used light bulbs, not an EL. In any case, the
EL's found commonly in the 2004/5/6 series from Radio Shack lose half their
life after 1000 hours of use. They have pretty much had it after 6000
hours of use. Life is determined by usage, temperature, moisture in the
material, and color. (Source, U.S. Scanner news, March 1991.)

The EL can be replace by sliding the old one and putting in the new one.
The 2004 EL is no longer available from Tandy Parts.

Kk> Hi, I have bought a pro 2001 and I have noticed something that seams
Kk> to indicated that it has an extra bank of channels. One day I turned
Kk> it on and all the frequencies that I programed in were gone but a new
Kk> set was in place. The "new" freqs were not random garbage.

Kk> Could someone tell me if the 2001 had a mod that gave it more channels
Kk> than its normal 16? And if so how do I reach them.

Kk> Any other information on the 2001 would also be nice, and yes I do
Kk> want a better scanner, just a matter of time...

Don't have any information on this unit but need owners manual and
schematic or service manualfor one that I have that doesn't work properly.
Do you have any of these that you would be willing to copy? I'm willing to
pay reasonable copying cost and postage.

all the best Ted

RN>It makes perfect sense. The results of your comparision imply that the
>PRO-43 is the better of the two becasue it is more sensitive. However
>there are two sides to every issue so compare how the two radios
>handle intermod and tell me which is the "better" radio. IOW, greater
>sensitivity is not desirable in every situation.

Roger, I agree with your statement completely. I was just surprised
to see the difference in the two. All around, I suppose the 2006 is
the better choice. Maybe I just got spoiled since I had the 2006 for
a lot longer.

1444. HELP differences between old/new PRO-46

Newsgroup: rec.radio.scanner
Date: 1995-07-22 00:00:00 UTC
From: resume@nr.infi.net
Message-ID: <3uqspm$4u9@allnews.infi.net>
Source record: 251637

Help me if you can.

I am shopping for an old, modifiable Radio Shack PRO-46.
I need to know how to tell the difference between the old
model (before RS re-engineered them), and the new model.

I have to assume that I may not be able to see the box
it came in, OR the instruction manual.
I need to know how to tell the difference by looking at
the unit itself.

Also, where can I get the instructions on how to modify
the unit?

Also, if you know of a scanner currently available
(retail or mail order) that can be modified, please
let me know. I want a portable, hand-held, battery-
operated.

Thanks, appreciate your help. -Dan-

1445. HELP-can Pro23 or Pro46 be modified (new models)

Newsgroup: rec.radio.scanner
Date: 1995-07-22 00:00:00 UTC
From: resume@nr.infi.net
Message-ID: <3upjca$nbs@allnews.infi.net>
Source record: 251638

Would appreciate your help, if you can.
Email if possible or answer here if easier.

Can the Radio Shack PRO-23 or PRO-46 portable scanners be modified
to bring back the cellular freqs? If so, how is it done?

One note: according to a Manager at a local Radio Shack, the FCC
ordered Radio Shack to send these models back for re-engineering
about 6-8 months ago. Supposedly the models currently on the shelves
have been modified so as to make them un-modifyable. So, I would like
to make sure that any modification instructions are about the new,
re-engineered models.

How do I tell the difference between the old and new models?
Seriel number differences? Codes?, etc.?

Thanks for your help.

I have two 2006 scanners and one pro-43. I have experienced the same scenario that you described. My experiment was a little different than yours. I used the telescoping antenna on the 2006 and the duckie on the 43. I found that the 43 was more sensitive on 162.55 mhz and in the entire vhf-hi band.

Date: 1995-07-22 00:00:00 UTC
From: netzoso@ix.netcom.com
Message-ID: <3uq529$s3f@ixnews7.ix.netcom.com>
Source record: 251732

Does anyone own a functioning ALN-PRT25A U.S. Army walkie talkie?

I found a surplus supply warehouse nearby that has several hundred in stock, all in the original seal packing boxes, bubble wrapped, mint physical condition, supposedly never used, supposedly fully functional with all associated battery and additional add-on parts & plastic sealed documentation...

They supposedly operate on slice of 6 meters...

The proprietor wants $100 for a pair of these. Is this a reasonable price for such equip...

My understanding is that they are very durable, combat proven radios that were used in Viet Nam by the infantry.

Please e-mail or reply to this news group if you have any information that would be helpful... Thanks in advance!

: : you in on the info that Bill gave me as to where to look for and fix the
: : BEEPING. (god I hate that!)

: : My second post....hope it makes it!

: : John Fischer

: Could you share that info with the rest of the group?

TO ALL:

I guess there are a bunch of Pro 20xx scanners beeping out there.

Heres what I got from BIll Cheek...IN A NUTSHELL.

The LOW BATT circuit consists of: Battery, snap & wires,R-224,R-223,
R-221,R-222, R-220,R-291, and IC-6 (pins 12,13,14), and CN-504,PIN 1.

The service manual will then guide you to the parts and paths that can be
checked at your leisure.

Thats about it. The only other thing to add is look for a defective
component thats listed or a broken wire path before or after CN-504, Pin 1.

My own personal note....Make sure you have the Service Manual! I've
looked high and low for these Resistors without the manual and couldn't
find them.

The catolog number for the service manual is:

20-144/9144

The Tandy parts order number I don't have. But I will tell you that they
only take a credit card when you order the manual. I would have thought
they would send the manual to a local store near you...then you could
pick it up and pay for it there...but NOOOOOO.

Thats about it. Good luck gang!

1451. PRO 37 Mods

Geeze, I don't remember ever seeing a PD car without one here in the Silicone Valley. LA either for that matter. In fact not too long ago Campbell City police (near San Jose) included in EVERY patrol car high sensitivity night-vision equipment as part of its standard gear. A few less cars than NYPD I'll grant you. And the Santa Clara PD just went to 800 MHz on every mobile and handheld radio. I heard it was digitally encoded, but I haven't confirmed that yet.

Glad to hear New York is letting its men in blue in on some technology finally! --Mike

Are you sure that it will allow alpha on all 500 channels simultaneously
or just on ANY 250 of the 500? On mine, you can program up to 250 alpha
channels and they can be anywhere within the 500 (unlike the 8500XLT
which would only allow the first 250 to have alpha).

1464. Re: Radio Shack's PRO-43 /w hyperscan - Question

I live in the Northern New Jersey area, and have had some decent success listening to the military band on my Pro-43. I'm using a RS discone into 50 ft of RG-? (the thick stuff). I have programmed into the radio Steve Douglass' "Top 150 Vhf/Uhf Military Frequencies" (I think Steve publishes a newsletter related to this). I connect a small Panasonic voice activated recorder to the radio and let it run all night and while I'm at work. When I get home, I generally have 45 min of condensed miltary comms which I listen to while reading rec.radio.scanner.

Just though I'd share my experiences.

>Can anyone tell me the diff. between the two?

Depends on which version of the 1500 you get - the 1500, 1500e, or 1500ex.

Each is an attempt at improving a mediocre design.

Compared to the AR1000, the 1500 offers manually-adjusted single sideband
tuning, a useless auto-store function during searces (stores birdies,
false signals, etc), poorer audio, and poorer battery life.

This is a good question.
We are starting to hear that several models of RS scanners that are being
sold in Canada don't adhere to the restrictions placed on scanners sold in
the U.S.
The only way to be sure, of course, is to open 'er up, and have a look-see.

VPD:Downtown 143.085, Patrol NE 143.385, Patrol SE 143.565, Patrol SW143.685
Those are all the dispatch channel (1 throuh 4 for Vancouver City
Police). In addition they use 143.025 as Tac5 and 143.775 as Tac 6.

Vancouver FD is dispatched on 151.505 and is very active.
BC Ambulance Service, including paramedics is all dispatched on 142.395
for the City of Vancouver. It is a very busy frequency.
Nearby RCMP freqs to listen to are North Vancouver dispatch 142.275,
Richmond 142.185 and Burnaby 142.545.
Canadian Coast Guard Vancovuer's SAR freq is 156.2 and is interesting
when active.
Have a great stay on the West Coast. The wx has been great...about 30
deg C last week in the sun. Warm (about 25 C today and cloudy). Bring
your rain gear just in case.

It makes perfect sense. The results of your comparision imply that the PRO-43 is the better of the two becasue it is more sensitive. However there are two sides to every issue so compare how the two radios handle intermod and tell me which is the "better" radio. IOW, greater sensitivity is not desirable in every situation.

Dane,

What are the cost of the Renewals (and charger). For the first time, I am trying Radio Shack's Hi-Capacity Nicads in my Pro-43 and I must say that I am impressed. I have not done any formal tests but I know for a fact that they are lasting much longer...both when the radio is on _and_ on the shelf.

The down side is that the batteries are quite a bit more expensive, between $5 and $6 for a set of two. However, I can now go to an airshow and not even bother bringing along a second set, something I couldn't do with regular Nicads.

FWIW,

Derek

Well, Websters Dictionary, an American tome says this about Arse:

Ass. see Ass[2]

Ass[2] says:

1. the buttocks.
2. the rectum.
3. sexual intercourse.

[before 1000; var of ARSB, with loss of "r" before "s" as in PASSB, CUSS, etc.;]

I don't have an Oxford English, or Slang Dictionary handy, but even if you can substantiate the distinction you're making as recognized British usage, it sure-as-hell ain't offical American. As a matter of fact, the pattern of consonent dropping indicates that arse is the more archaic, and most Americans would view it as arcane, British stuff. It's just not used in American English, and you're absurd to want folks in a NYC newsgroup to write British. Sorry dude. :P

In fact, if you're gonna be so _anal, you ought to worry more about your spelling (poor typing's no excuse). I suggest brushing up on:

clasic
dieing
imature

You might also reset your grammar alarm:

is because???

American children would be petrifed to use a poofy British word like arse,
you got that right, bubalah. It musta been you who made this same idiotic
"correction" in another newsgroup. Stop correcting proper American
English, when your grasp of English just plain sucks.

Lets see some style -
Lights
Cameras
Axion

Phew! I feel much bedder. :)

As a user of nicads for many years I must say I like the new Renewal
batteries better. They are rechargable alkalines that will charge up to
25 times. I use them in my Pro-43 and get much more use time than I did
with nicads. Seems like 2-3 times the live but I have not measured it.

I just replace my first set. I think I charged them about 12 times and
was down to about 3 hours of use before they died. I understand that if
you really drain them that reduces the life and I killed mine every time
and got about 12 charges out of them.

: Well, that's not REALLY parallel data that goes to the display. It's
: MULTIPLEXED data with all sorts of weird things that complicate the
: simplistic view. I tried that several years ago, before I knew what I
: was getting into. Made no headway and was later laughed at by those
: more in the know than I.

I've done this before and it's not a simple hack - the likes of which
you're famous for. The LCD display is on the "bus" line and has a "data" pin
on the input or will recognize a "device" number in a serial data stream.
Perhaps it might be manchester-encoded? Hmmm....8-)
When you use a logic analyser it's not very difficult to figure out.
However, someone who advocates the use of WD40 as a potentiometer
lubricant like yourself clearly wouldn't be interested in such "high
technology" I am sure.

: The other alternative for cases where the CPU and LCD Display Driver
: are on board the same chip is to go out to the PLL circuit and
: intercept the (usually) serial data that goes there. But this is a
: very complicated data stream, more complex than the serial data
: between CPU and Display Driver and I never made much headway with it
: either. The PLL data is the key to the OptoElectronics 456 Interface,
: though. Somehow they managed to make use of that data, and/or
: substitute their own with that from the CPU.

I've done this too. Data for PLLs it typically four-bit binary with
several nibbles required to generate the frequency. Unless the chip is
some house-numbered obscure thing the data should be
available. There are divide-by's to be considered too - especially in a
scanner. It would be cussid to reverse-engineer this kind of thing to
be sure. Cheek, you should have asked for help first and then your
gadget might not have been so inferior to the 456.

Have a nice day!

Andy

FRED (F***ing Rear End Device, or Flashing Rear End Device for those of a more conventional frame of mind) is the device on the rear end of the train. Most North American RRs use 457.9375 MHz and transmit ASCII data, while Norfolk Southern uses 161.115 and transmits DTMF codes. WILMA is the part in the cab; if equipped with remote air release capability, this transmits back to FRED on 452.9375. As far as I know, NS does not have this capability.

Bill,

AP>The formulas (far more accurate than you require) are as follows:
AP>Distance in nautical miles=D*60 (1nm=1 arc minute)

BC>Andrew, that is not particularly accurate.

Well, let's see now - Mr. Bunyon asked for formulas
accurate to within one part per 300. After doing some
further digging (which you appear to be loathe to do),
I have found some reasonably recent sources that put the
Earth's mean circumference at about 40,008.18 kilometres.

If anyone cares to use a different measure, just adjust
the revised constants accordingly.

My old formulas:

Distance in nautical miles=D*60

Distance in statute miles=D*60*1.15078

Distance in kilometres=D*60*1.852

Revised formulas:

Distance in (international) nautical miles=D*60.0074694

Distance in statute miles=D*60*1.1509228

Distance in kilometres=D*60*1.8522307

These new numbers represent a change of less than one part
in 8000. Big deal.

Just for fun, let's look at your initial response:

BC>You need a "Great Circle" program of which there are many
BC>out and around, and they are more accurate than your spec.
BC>I have several on my BBS somewhere, I think.

BC>I also developed a spreadsheet model and published it in my
BC>recent ULTIMATE SCANNER book as well as in a recent back
BC>issue of Monitoring Times Magazine. This model is available
BC>from my BBS as an EXCEL 5.0 sheet and as a MS WORKS 3.0
BC>sheet.

You want him to call (long distance, no doubt) and then
hunt for the files. Typical dumb Sysop mentality...

- or - he could avoid that hassle by buying your publications...
How thoughtful of you.

Hi Curtis,

That's not going to work, these two have been going at it for months in the FIDOnet SCANRADIO conference.

It seems that the best thing to do is stay out of it and let them go at it till they get tired. But if you think you can get them to stop, all I can do is wish you luck.

Hi I am also using a TV antenna with my scanner.TV antennas are made
to receive 470mhz-750mhz.I bought a used ChannelMaster from a local antenna
dealer/installer for $10.I was almost there top of the line UHF antenna with
about 13.5db gain at 450mhz up to about 20db at 700mhz.I also bought
a Radio Shack TV/Scanner mast mounted 20db preamp.Came down with RG6 cable
around the rotor.BOY can I receive with this combo.
To mount this antenna rotate the mast 90 degrees and drill two more holes
and use the original clamp. (I ment to say - rotate the boom and drill
two holes) anyway any questions send me Email
Good Luck

There were some scanners that you could do that to. They all were pulled from the shelf and reworked. The ones you can buy now, or within the last 10 months are the ones that don't allow that feature. Aparently some of the freqs that were loaded in were cellular. I'm sure somebody somewhere lost thier job over that slip up. If there is an orange dot on your scanner or box, be assured the key strokes won't work.

>of you out there:

No, it's slimier than that. They bill your home phone, just like a #900,
under the guise of a long distance company (Integretel). Now, this
is all probably illegal, and most definately unethical.

>(a) own a demon dialer or can write a script for your comm program
>(b) live in an area where ANI is not passed on properly for 800 calls

I like to just call and leave it off the hook for as long as they
are connected. Of course, I get billed for this, but I call the
phone company and explain that the charges are bogus and that usually
fixes the problem. of course, it's kind of a pain in the ass, but
it's not like I have a lot of better things to do.

Using a splitter will cost you at least 3 db of signal, and unless each
antenna is highly unresponsive to signals on the opposite band there could
still be some interaction between them.

For receive only applications, you can use a 75 ohm VHF/UHF separator-
joiner intended for MATV use. These look just like splitters but combine
separate VHF and UHF inputs into a single output; offering something like
35 db of opposite-band rejection and an insertion loss between 0.5 and
0.8 db. (I'm recalling these from memory, so consider them approximate.)
The crossover frequency on the one I use is somewhere in the 300-400 MHz
range. You can get these things for about $2 each, but might have to
use mail order if there is no shop in your area which stocks MATV supplies.

From: wired@genes.pl.my
Message-ID: <806499927.20571snx@genes.pl.my>
Source record: 251653

Is it normal? I can pick up my Opto MiniCounter 3300 on 300MHz AM.
A short beep is heard whenever the opto makes a measurement.

Is it normal to receive `spurious' measurements around 390-450MHz
without the antenna connected? When I tune in to those freqs, I get
nothing.

Are scanner antennas suitable for the counter? How well does the DB32
perform on 2m, 70cm and cellular? Does it have a BNC connector? Can I
actually use it on a scanner?

thanks

This foolishness known as the Electronic Communications Privacy Act (ECPA) makes the elected officials in the US look like a bunch of twits to the rest of the planet. It is reminiscient of the famous "PI shall be equal to exactly 3" legislation that was attempted there.

Fortunately, much of the rest of the world has less powerful lobby groups and politicians willing to accept the laws of nature...

To get the straight story here in Canada, I called the Canadian Department of Communications. They offer information to the public through the Industry Canada network. It's a local call for most of the population of Canada. I got a very nice, helpful, knowledgeable person on the very first call, after two rings, on a Friday afternoon. She answered all my questions (about ham radio & marine radio licensing, setting up low-powered transmitters, sources of frequency allocation information, and -- incidentally -- cellular radiotelephones) She sent me a *huge* information package that arrived the following Tuesday, completely free of charge.

Included in the package was a information pamphlet: "Everything you wanted to know about cellular radiotelephones and privacy... but were afraid to ask!" This is one of their watered-down versions of the "Radiocommunication Act," i.e. readable by mere public.

In that pamphlet were these quotes:

"Since modern radio technology makes it relatively easy for anyone to receive all radio signals, there can be no reasonable expectation of privacy. Some people have compared radiocommunication to opening a window and shouting across the street."

"Legislation alone cannot prevent people from listening to the radio signals of others. However, if you do intercept somone's radiocommunication, remember it is an offence under the 'Radiocommunication Act' to divulge or use the information obtained." [journalists & tow-truck operators note!]

It's good to see that sometimes our elected persons behave in a rational manner...

I've got a question for the group. What if I gave blanket permission to
anyone who wanted to listen to my cellphone calls? Would this then make
monitoring my calls illegal?

By using my cellphone, I am fully aware that my calls are NOT PRIVATE and
therefore am not "afraid" ;-) of having someone intercept them.

Maybe I ought to state at the beginning of my phone call that
interception of this transmission IS permitted by the general public.
Since I am the benefactor of the transmission wouldn't I be allowed to
determine this? Would kind of take the steam out of this silly law if the
majority of us did that!

From: e222c@aol.com
Message-ID: <3uu034$8ei@newsbf02.news.aol.com>
Source record: 251659

I've had my AR8000 receiver for about 7 months now. I think it's the best handheld, maybe best scanner period you can buy. More sensitive than any Bearcat I've owned including the new 3000XLT. So many features too. You can spend all day playing with this radio and not get tired of it. Very good shortwave performance too, when hooked up to a proper shortwave antenna. The only thing it doesn't do that I want it to is channel delay for individual channels instead of all channel delay. I really don't miss the cell band being blocked out because the reception is excellent on 1419.9-1442.9MHz. Even better than my 200XLT which is unblocked! My only complaints are that yes the case does not seem as bullet proof as a Bearcat handheld scanner and the rubber control knobs are flimsy. And I would prefer the keyboard be on the upper third part of the radio as oppossed to the lower third. Overall I think it's money well spent if you're really into scanning.

I often monitor frequencies that cannot be found in any reference material.
These are probably agencies operating on unlicensed frequencies. Is there
a publication available anywhere that lists these illegal stations?

>Mission Viejo, CA PD freq.'s please E-Mail

I truely suggest that you get a frequency guide as O.C. has so many great freqs to listen to. However, for the freqs that you requested, they can all be found between 460.000 and 461.000. To really enjoy your listening experience you will have to break down and get a guide like I mentioned. I suggest Scan Fan if you can find it, but Gene Hughes' Police Call is pretty good too (NOT the Radio Shack version, but the one that you can find at CB and Ham shops). Happy Scanning!!!

Robert

1528. Handheld Antenna!!

Newsgroup: rec.radio.scanner

I'm no expert, but I recently followed the advise of someone in this group (unfortunately, I don't remember their name) and bought Radio Shack's center loaded telescoping antenna for my Pro-62. I am so far quite impressed. I tested it out in the 46 MHz range, as I know that there are some short range transmitions in this range [of coarse I NEVER listen to them ;)]. With the stock antenna I got nothing at all. With a standard 19" telescope I was able to pull in a few readable and a few static signals. However, with the center load, I was able to hear the signals that had previously only been static and was able to pull in some new weak signals. I also tested the antennas in the 151 MHz area and again got the same kind of results.
I just thought that I would share this bit of info with anyone that might like to read it. If you are interested, the antenna costs about $10 at Radio Shack.

Happy Scanning.

Try the following frequencies:

3407
5562
6673
8876
10015
13345
17901
21937

All of the above usually are using USB.

The following GUARD frequencies are in use:

123.05
304.80
4701

Good Luck!

Carbon County in Pennsylvania is building a newer state of the art enhanced 911 center. Fire companies will use three freqs. I believe for tone-outs then for fire ground and still another for mutual aid. Supposedly the pager will clear itself after the tone out. My questions are Does anyone know or where I can find the new freqs. and how will they do this. Will open pager monitoring become a thing of the past. I do know it is a Motorola system. All 30 or so areas will be asked to buy new radios in the next several months at a whopping cost to the taxpayer and volunteer companies. Their excuse was that low band equipment is not being made and outdated. We live in a very mountainous terrain and I thought low band scatters better coverage in mountain regions vs. the new uhf.And last any one know of great deals on Minitor two pagers in the UHF. band. News Admin (news@iquest.net) wrote:
: Are you sure that it will allow alpha on all 500 channels simultaneously
: or just on ANY 250 of the 500? On mine, you can program up to 250 alpha
: channels and they can be anywhere within the 500 (unlike the 8500XLT
: which would only allow the first 250 to have alpha).

I'm not sure. I haven't tested it to see if it will allow alpha on all
500 channels. I just know that my manual stated that alpha was allowed
only on the first 250 channels, and that the scanner would reject any
attempt to program alpha characters in channels 251-500.

Of course, my main concern is still the backlighting scheme, but I'm
beginning to think that no one can give me any information on that.

Hi Bill,

Bill Cheek (bcheek@cts.com) wrote:
: mike@dino.eng.monash.edu.au (Mike Paull) wrote:

: Yeah, that doesn't help in terms of needful information relative to
: controlling the scanner by a PC. Control is possible in only one or
: two ways: intercept and replace the PLL data; or use keyboard
: emulation techniques.

: >Ok, well the Pro 2011 is one of those unfortunate scanners that has the
: >LCD driver built into the CPU.

: Yes, the only scanners that have separate CPU and LCD Display Driver
: chips are the PRO-2004, PRO-2005, and PRO-2006.

Ok, as this is only a personal project I won't be loosing any sleep
over this.

: >: That's nice.....we call it the data acquisition mode, which stands
: >: apart and separate from the control mode which programs the scanner
: >: from an ASCII text file.....and more or less bypasses the CPU in a
: >: sense.

: >Now I can see, two modes. Programming (dump) mode via simulated keypress
: >or control mode via the intercepted serial data.

: Nooooo. Programming and control are one and the same. Control goes
: one step farther in the sense that you can -=control=- the scanner
: from the PC keyboard in addition to programming, but both are
: "control". Data Acquisition mode is intercepting and utilizing the
: Display data in the scanner.....channel #, frequency, mode, functions,
: etc. The two are distinctly different animals: control and data
: acquisition.

I didn't realise that this was possible from the data lines within
the pro-200x series. I wonder if the new Uniden Bearcat 9000XLT will
be able to be interfaced in a similar way.

: >Thankyou for taking the time to explain, everything understood.
: >Looks like we might have to have a go at decoding the PLL data I think.

: For the PRO-2011? You've got to be kidding? Unless it's a purely
: personal fun project, you're going to invest a lot of time and
: resources into a non-paying proposition. For personal fun and
: enrichment, that's one thing. But don't hope to derive any gain

Basically, its for fun and personal enrichment. That and the fact I spend alot of time at work so it gives me a way of checking up on various frequencies for activity that otherwise might take weeks longer. If I am unable to use the PLL I will at least be able to program and control the scanner through keypad emulation.

I am going to send a copy of the instructions for the keypad control version to one of the local CB/Scanner/Ham mags with instructions on how it can be modified for use with the AOR-1000, seeing as I also own one of these and the idea would probably appeal to these people than the limited number of pro2011 owners.

: otherwise. No one I know of uses a PRO-2011. And the people who do
: are largely out of touch with the real world......meaning they don't
: subscribe to magazines and don't romp around in cybermedia. They're
: out of touch and can't be reached, you see?

One of the reasons for starting with the Pro2011 was its a nice, cheap testbed for these sorts of projects. No loss if it gets damaged , the AOR on the other hand.....

: Largely victims of a predator Radio Shack salesperson.........

Heh, guess some things are the same the world over.

Mike

Those East Bay PDs sure do know how to do things, especially places like
Freemont.

Out here in Fresno, almost all cars have MDTs. They are the nice laptop
sized models that fold up and get out of the way when you don't need
them. Trust me, I know what it is like to slam your knee on one of those
things. Wonder how long till CHP goes to MDTs. Would cut Radio traffic
substantially. No more calling in for clearances.

To the poster who asked, MDTs are Mobile Data Terminals, on board
computers essentially. From them you can converse with other cars (Just
ask the LAPD!) Run checks on subjects and licenses, and in some cases
type up reports that can be downloaded at the station later.

Restoring cellular coverage to the 2026 is easy. Turn the rig over and remove the bottom cover. Right in front, near center, is jumper L201. A quick snip and you're done. If you're unfortunate enough to have a rig made after April 94 - you're screwed. They don't have a L201 jumper. If someone knows of a mod for the mew version - I'd like to hear about it.

Los Angeles County Sheriff helicopters, like most other law enforcement agencies, work on the same frequencies that the ground units are on. In the case of Los Angeles County, this would be the SRC pair (dispacth) or one of the tactical frequencies, L-tac (Local Tactical), A-Tac (area tactical) or C-tac (County tactical). You can also try 123.025, this is what they would use to talk to the base at Long Beach or China Flats in the mountains. Best bet is to listen to the regular channels.

>Does anyone know the frequency of the Los Angeles County Sheriff's >helicopter?

I've never monitored LASO, however, I assume that they do things simular to other agencies. Helicopters usually communicate with ground units on the local frequency for the area that they are assisting in. In the case of the LASO, I did find a freq of
123.025 MHz (AM) for Sheriff Helicopters, but I would assume that this is for air traffic communications (???).
In case you don't have them, the LASO operates between 482.8125 & 484.1625 with three others at 486.0375; 486.1875; and 486.4125.

Hopefully this helps!!!!

The PRC25 operates from 12v. I used a VHS port-pack gell cell.
The radio is interesting, but don't pay too much. A typical 2M ht
will outperform it under most circumstances.
The other rub it the PRC25 is a wiiddeeband radio. I have not checked
latly, but I think only narrow fm is allowed on 6Mtr.
The PRC25 is usefull to listen to VHF tv audio. It was usefull for
listening to the old British vhf audio... I gave mine away after
I bought a Pro2004.

I must have missed something...the Pro-43 (*mine*, anyway) uses size AA
batteries, not D.

I have not looked lately, but at one time I thought RS did not have
a high-capacity version of the AA NiCd, because the AA was already
a full-size device. I thought only the C and D were offered in the
higher capacity version, because the cheapies only had a AA-sized cell
inside the cases.

...Or, maybe there is a difference?

>mode. Any help would be appreciated.
>
The procedure for programming it is as follows:

-Hit the program key.
-Hit the [UP] key.
-Type the frequency you want to search to [148.5] .
-Hit the [LO] key.
-Type the frequency you want to search from [144.2] then hit [Ent].
-Then hit [FS] fast scan or hit [SS] slow scan.

Have fun with it!

Well, 750mAh NiCds are available here. Or maybe you should go for
the 1.1Ah NiMh AA cells. Bad thing is that they won't retain a
charge for long.

Here is my keypad beep delete mod for the PRO-43:

1. Remove battery.

2. Remove back cover (4 screws).

3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).

4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.

5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.

6. Reassemble.

I am looking for the frequencies that the Constables use
in the Houston Clear Lake area. These Constables drive
around in white police cars. I suspect they are on a
800 Mhz trunked system, but I'm not sure. Can anybody
out there help me out?

1568. BC2500XLT / date codes

Newsgroup: rec.radio.scanner
Date: 1995-07-24 00:00:00 UTC
From: "Dan Z." <danzahn>
Message-ID: <3v0hk9$c6g@senator-bedfellow.MIT.EDU>
Source record: 251703
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I recently returned my BC-SC150 because the options it came with
didn't interest me (pre defined limits....)
and instead paid the extra money for a 2500XLT. I find this unit
to be an excellent unit, but have a few questions...

it comes with a date code of OEIC.... could someone please help decode the date
and/or post the date codes for the Uniden mfr....

Also, the booklet that it came with clearly states that the cellular freqs
are blocked out, yet this radio seems to do the 760 MHz to 1.3 GHz straight
without the blocked frequencies. Is this common, or did I just get lucky
in my purchase.

In addition, this radio does not receive between 550 and 760 MHz...
what is on those frequencies?

I really enjoy this unit because of the features, and I do not mind the slower
scanning times compared to the SC150.... (100 chns/sec max compared to
300 Chns/sec max on the SC150 in turbo modes)

Also, does anyone have the complete list of "hidden" options on the BC's?
I saw a complete list, but forgot where and forgot to make a copy.

Thanks for all your help.

I've read that the performance of an antenna that is multiple-wavelengths of the frequency of interest is hard to predict, but, often quite good... for receiving, I'd guess it would be just fine...

> I'm no expert, but I recently followed the advise of someone in this group (unfortunately, I don't remember their name) and bought Radio Shack's center loaded telescoping antenna for my Pro-62. I am so far quite impressed. I tested it out in the 46 MHz range, as I know that there are some short range transmitions in this range [of coarse I NEVER listen to them ;)]. With the stock antenna I got nothing at all. With a standard 19" telescope I was able to pull in a few readable and a few static signals. However, with the center load, I was able to hear the signals that had previously only been static and was able to pull in some new weak signals. I also tested the antennas in the 151 MHz area and again got the same kind of results.
> I just thought that I would share this bit of info with anyone that might like to read it. If you are interested, the antenna costs about $10 at Radio Shack.

I agree this is the best all around handheld scanner antenna. RadioWare sells a whip antenna that is great for everything above the VHF-lo band. Costs about $60 I think. For a low band whip try a Antenna Specialists VHF-lo band whip. Works well on other bands as well. About $20 and only available from a Two way communications dealer. Call AS for a catalog.

: encrypted digital transmission.

Do they use (and can your scanner detect) CTCSS tones ?

You could program the frequency in several times and use a different tone for
each channel (and lock out th MDT channel by it's associated CTCSS tone).

Still not 'simple' but gets rid of the MDT (and DVP too).

1579. FS: PRO-51 >>>UPDATED<<<

Newsgroup: rec.radio.scanner
Date: 1995-07-24 00:00:00 UTC
From: jbd@spcfs2.nsc.com
Message-ID: <DC8JDt.F9M@nsc.nsc.com>
Source record: 251714

I've got an "as-new" PRO-51 (11A3) for sale. It is
in the original box with manual, antenna, etc. and is
cellular capable via the keyboard, no diode/circuit
mods required. Barely used, you will not be disappointed.

Every unit I have seen at Radio Shack has a date code
of 8A4 or later. These will NOT load the required
888MHz test frequency when put into test mode.

By Uniden, similar to a SportCat-150 but 200 channels
and cellular capable. Unlike the SportCat the Pro-51
uses standard AA batteries so you don't have to go
to Uniden to get a spare battery pack.

$180

Eugene, I just turned on my minicounter to find out, and my Pro-43 picks up the minicounter on 300 Mhz just like you said. I don't know the technical reason behind it but I imagine it's like receiving a 'birdie' on your scanner, which is related to the internal frequencies generated to receive an external frequency.

My 3300 gives measurements of background RF noise at around 175 Mhz with no antenna when in the 250Mhz-2.8Ghz range. But I imagine this would vary according to any transmitters in your area such as paging and broadcast FM or TV.

As far as antennas go, from what I've read, it's best to use an antenna that's the proper length for the frequency range you want to 'count'. I believe the formula is 300 divided by the frequency in Mhz equals the wavelength in meters (i.e. 50 Mhz Ham band = 300/50 = 6 meters. This is the '6 meter band')Obviously, though, any antenna is better than none, you just may have to be closer to the signal source with a scanner antenna on the counter than with one at the proper length. Although this can work for you too; when there are multiple signals transmitting at the same time, attenuating the signal by using the 'wrong' antenna, or no antenna at all can give you a better clue that the measurement you're receiving is from the closer transmitter (other variables being equal). Those variables are what make hunting for frequencies and this hobby so interesting. The catalog that Optoelectronics sent to me has several different antennas for different applications.

Hope I shed some light on the subject.

>
>

Hi Lynn

I work for the Post Office in North New Jersey, and just went through the "Window Training Academy" (Oooo Boy!!). Here's what the Domestic Mail Manual says about COD (Collect On Delivery):

DMM section S921

1.0 Basic Information

Mailers may use collect on delivery (COD) service to mail an article for which they have not been paid and have the price AND THE COST OF THE POSTAGE (RN: if you desire) collected from the recipient. The recipient may remit the amount due by cash or by check payable to the mailer. The USPS forwards checks to the mailer. If the recipient pays by cash, a postal money order is sent to the mailer. The amount collected from the addressee may not exceed $600. (RN: that's the max value of a domestic money order)

1.2 Availability

First, Third, Fourth and Express Mail may be sent COD (see manual)

1.5 Fees

The applicable COD fees must be paid in addition to the correct postage and the fees for any services requested (RN: for example Return Receipt or Restricted Delivery). The amount to be collected or the amount of insurance coverage desired, whichever is higher, determines the COD fee. The fees for COD service include insurance against loss, rifling, or damage to the article or failure to receive a postal money order, or the recipient's check. Postal liability for failure to receive the recipients check or a postal money order is limited to loss in transit.

Note: to insure item for more than $600, you must *Register* the item which is a separate service with its own fee. Registered mail is insurable up to $25,000(the amount the sender receives in case of loss or damage), although the amount to be COLLECTED from the addressee still may not exceed $600. Use this for example if you're sending a $1000 item for which the addressee has already paid you $400, and owes you $600. You still want to insure your item for the full $1000 value, and you receive the outstanding $600 by COD.

COD Fee Amt to be collected or insurance coverage desired
------------------/----------
------------------------/
$3.50 $0.01 to $50
4.50 50.01 to 100
5.50 100.01 to 200
6.50 200.01 to 300
7.50 300.01 to 400
8.50 400.01 to 500
9.50 500.01 to 600

In addition, the addressee will pay $0.85 for a money order if he pays by cash. The Post Office takes care of cutting and sending the money order. A check payment is made out to the ADDRESSEE and the Post Office merely passes it along.

The time it takes to get your money back depends on:
1) the method you use to send the item (Express Mail = 1-2 days, 1st Class = 2-4 days usu., Parcel Post = 5-10 days usu.)
2) The time it takes to deliver after arriving at the delivery post office. Your addressee may not be home, in which case the P.O. holds the item up to 30 days (time is specified by you) for the addressee to come in and pick up the item.
3) the time it takes to process the paperwork and mail you your check. (figure about 3-5 days average)

I took the time to write this all out because COD is a common way for two people in geographically separate places to buy and sell their radio equipment, and I find that a lot of people don't know much about all of the services the USPS has.

I don't know if any other mail services do COD's. I'd like to hear from anyone who knows.

Hope this helped you, Lynn

What you are getting are images of cellular frequencies.
FCC rules say that scanners made in the US or imported into the US after
April, 1994, cannot tune to the cellular frequencies. These rules don't say
anything about images, though.
Images are usually found this way: take your first IF frequency, double it,
and that's how far the image is from the original frequency.

I don't think that would work, legally.
The ECPA grants you certain rights, privacy among them.
The Supreme Court has determined that you cannot give away your rights (the
Gov't can take them, but that's another post...).
Therefore, I believe, you can't do this. (I don't agree with this, it's just
the way I see things)

That these frequencies aren't listed doesn't mean they are illegal. Most
frequency lists nowadays use an FCC listing in some way.
The FCC does not control all frequency allocations, although they would like
you to believe they do.
Most Federal radio users are not governed by the FCC, so their listings
won't show them.
Also, many frequency allocations for commercial air operations are also not
covered by the FCC.
These are not illegal, just not covered by the FCC.

Rick, Thanks for taking the time to share that. As I posted elsewhere today, UPS does take longer to send back the money, but their fee for a package to New Jersey was $12 vs. $60 for Fed Ex. This was for 2nd day service. The cod fee and insurance added about $8 more dollars.

Thanks, Lynn

I'm going to be spending some time here in Charlotte, NC, and I have a couple of questions.

First...where does Charlotte PD transmit? A search through both VHF and UHF brought nothing, so I'm assuming that they're using a trunked 800Mhz system (?)

Second...(and most importantly)...a handheld scanner in a moving vehicle. Legal or illegal in North Carolina? South Carolina?

Thanks,

Drew

I think the big difference between Police Call and most of the other printed directories, is that PC is based on
FCC records with user input added to help identify frequencies, while most other directories begin with user input
and just cross reference with the FCC records for accuracy. Police Call is not the best directory if you are just
starting out, because many/most of the frequencies will be quiet, while the other type of directories usually only
include the known channels that are in use.

Date: 1995-07-24 00:00:00 UTC
From: z_lottbk@titan.sfasu.edu
Message-ID: <1995Jul24.124755@titan.sfasu.edu>
Source record: 251782

Anyone know the mod for the PRO-2004?

I've already done the 800 Mhz mod, I've heard
there is a mod to get 400 channels and Hyperscan?

Brian

Also, what is the legal issue on scanning cellular phone
PN>calls? I've heard that it's okay as long as one does not discuss
PN>what he or she heard to another person.

Apparently it is legal in Canada. It is definitely not legal here in
the US. But, unless you plan to do so out of doors, it is not likely to
be caught. However, unless your town in a lot more interesting than
mine, cell calls are a giant bore.

Unless you buy a converted scanner, you are not likely to be able to buy
one that will pick up cell calls. It is short lived phenomena anyway,
since over time, they will all go to digital cell and that will be the
end of scanning them.

Well, it turns out that the backlighting is actually done by 4
incandescent bulbs, rather than an EL panel as I had mistakenly assumed.
Knowing that, I can now say that I have no complaints about the BC-9000
whatsoever.

I have found several cell conversation images on my scanner.
However, I usually only hear one side of the conversation going on, when
one of these comes up. The other person is being heard but they are
usually so faint that I cannot hear them. Can someone
explain why this occurs, and if there is anything that can be done
about it.

Thank you,

I would suspect the reason why you hear these one sided conversation is
because of the nature of the cellular phone. The cellular telephone
only has to cover the distance from it to the nearest cell, while the
cell must be sure to cover the entire area that the phone may possibly be in.
This means that the cell base must transmit more power to garentee it reaches
the phone than the phone transmits to it.

i.e. assume a circular area coverage of the cellular
network. The cellular base must be able to cover the entire area of the
circle (pi * r^2) but the phone only has to cover the distance from it
to the cellular base (a distance of r maximum before another cellular base
takes over.). Thus when you hear one side of the conversation, I would
suspect that you are actually only hearing the ground network phone
(transmitted
from the base station) and not the cellular phone of the person because the
cellular phone is too far away from you for your scanner to receive it.

If this is untrue, please correct me, this is all based on assumptions.

>hours of use. Life is determined by usage, temperature, moisture in the
>material, and color. (Source, U.S. Scanner news, March 1991.)

Well, I'll be. I peeked in through the mobile mounting holes, and there
are 4 little incandescent bulbs in there. I assumed that the 9000 used an
EL panel because a review I read said to keep the backlight off when the
scanner was unattended to maximize its life. I see now that the reason
for that was to keep the lights from burning out, rather than to keep an
EL panel from going dim. That's what I get for assuming, I guess.

It looks like it would be a royal pain to try to change those bulbs, but I
bet it will be a lot easier to find replacement bulbs 5 years from now
than to find a replacement EL panel.

Thanks for the info. Now I won't have to scan in the dark.

>inside the cases.

Radio Shack has two lines of nicads that come from two different
manufacturers and use different chemistries.

The blue cells are low capacity. The AA's are something like 550 mAH
(maybe 600 now) and use traditional sintered-plate electrodes.

The Varta cells, in the gold sleeve, use foam electrodes and deliver
higher capacity - the AA's are 850 mAH.

Foam electrode cells can't deliver the huge current that older designs
can, so they may not be as suitable for, say, a ham transmiter.

Panasonic already has 900 mAH penlites on the market, and with a 1000
coming soon, they're rapidly closing the gap to the NiMH cells.

My AR1000XLT has a similar quirk, noticed only when I'm trying to set the
squelch right on the edge. It seems the radio will hold on a 'hit'
frequency, but the audio won't open to the speaker. I'm wondering if
there are really two squelch circuits (one to the scan logic, and one to
the speaker mute), and the scan squelch is a bit more sensitive.

Basically use NFM for the normal poilce,fire,ems amd business bands. Use
AM for 108-136 and 225-399.999 except the WFM satellites. WFM on the TV
and FM radio freqs.

Source record: 251535

Hi Ram,

No bother at all. I hope the info will help you.

The Yaesu FRG9600 is an older table top scanner from the mid 80's. It has flourescent(sp) display. 12VDC. 100 channels with memory. 88Mhz to 960Mhz, continuous. The modes are:AM, FM-narrow, FM-wide. FM-wide means it will receive TV off the air or cable. There is a video output to a monitor for the TV portion, or FSTV, SSTV.

I hope this helps.

Lawrence

From: ebrady@freenet.columbus.oh.us
Message-ID: <3v40bn$pq3@acme.freenet.columbus.oh.us>
Source record: 251537

I was scanning for some new frequencies last night when I found data
being broadcasted on the following frequencies:

75.920 Mhz
75.420 Mhz
75.460 Mhz
75.540 Mhz

These channels didn't sound like pager channels but where broadcasting
data. Anyone have any idea what might be on them??

(Columbus, Ohio)

Thanks,
Ed

How can the FCC order them to do that? I thought the law applied to new
scanners only. I have never heard of a company being forced to redesign
something to make it comply with a new law.

1628. AR8000 System Data

Newsgroup: rec.radio.scanner
Date: 1995-07-25 00:00:00 UTC
From: Philip Clark <pgc@cs.adfa.oz.au>
Message-ID: <1995Jul25.223213.4824@sserve.cc.adfa.oz.au>
Source record: 251539

Having just acquired my new AR8000 (Yes, it works very nicely thank
you!) and the
RS232 interface unit, I have a question for those with a little more
experience than me.

Has anyone tried to dump the system data to a computer file then to
either reload the
file back to the receiver or to clone another receiver from the computer
file?
Did you try editing the system data?

If so, how did it go? Did you find any problems? Was any special
communication
protocol necessary or was a simple no-handshaking serial connection all
that was
needed?

Any comments or advice would be most appreciated. Thanks in advance.

1632. AR8000 jumpers / serial number?

Newsgroup: rec.radio.scanner
Date: 1995-07-25 00:00:00 UTC
From: jbadger@portdusol.cray.com
Message-ID: <1995Jul25.152059.4780@walter.cray.com>
Source record: 251543

Hello all...

Can anyone tell me what the J7 jumper on the main board in the
ar8k is used for?

Also, is the serial number 1) etched onto one of the boards somewhere
or 2) encoded into system memory? Or is the stupid little sticker on
the back of my radio the only way to identify it as mine!?

Thanks in advance...
Jon

Speaking of which. One night while motoring down the 91 I witnessed a
high speed chase with several SO Cars in pursit and a helicopter overhead.
I switched over to L-TAC and monitored the whole conversation. I wish
I had a tape recording of it. Talk about great stuff. Of course, the
ultimate thrill is riding in a police car stopping a stolen vehicle. Talk
about stress! Think about it! While they stop? While they surrender? While
they shoot?
No wonder cops have so much stress!

Some things to try: 1) you can try installing a filter in the antenna and power hookups (Radio Shack has them, as well as most auto parts stores) 2) use the best spark plug wires and coil wire you can - this doesn't mean the most expensive, but the ones with the best sheilding. What is happening is that you are picking up the high voltage of the ignition through your scanner. One last thing, is the case on your scanner metal or plastic? Plastic stops almost no interference, but can be coated and that will help. Best news - all of this is pretty cheap except for the wires (and they should last for quite a while). Good luck.

>anywhere that lists these illegal stations?

Regional scanner clubs publish newsletters with this frequency
information. The frequency lists are almost always "loggings" of
stations actually monitored, and may contain details like PL codes
and on-air IDs used in addition to callsigns (if licensed).

For example, the current issue of the CARMA (Chicago Area Radio
Monitoring Assn) newsletter published a report about a local
business's bootleg radiotelephone interconnect system I
found operating recently on 149.515 and 440.1 MHz, including DTMF
access codes.

Recommend you consider joining the RCMA (Radio Communications
Monitoring Assn). Each issue of the monthly publication lists smaller,
regional scanner clubs. Inquiries about RCMA membership should
be sent to RCMA General Manager, P.O. Box 542, Silverado,
CA 92676, USA.

The AOSC (All Ohio Scanner Club) is another great club. See the
FAQs for details.

I've been a member of RCMA, CARMA, and AOSC for over 10 years
and "hard to get" freq info is their (our) forte. These clubs
are staffed by volunteers and frequency info comes from the
membership -- legions of active monitors.

Their radios can talk to almost anybody - they have radios on CHP, LASO,
and most of the local police departments (I seem to remember a friend
telling me that they have 200+ channel Bendix-King radios on low band,
high band, and UHF, plus the normal aircraft radios...).

If any of you have some good 30-50 MHz E-skip loggings, I would aprreciate seeing them. I'm building a database of VHF low band F2 (long) and Sporadic-E (long) skip loggings. What I'm looking for a loggings containing the 1: Date 2: Time 3: Frequency 4: Receive Mode Used 5: Language Heard 6: The confirmed callsign/identity of the station 7: Receiver Used 8: Antenna Used 9: Your location when you logged the station. Item 5 , the station ID is especially important since I can only really use solid IDs.

This last E-skip season (mid-June to late July) I was quite busy and only able to listen for a few hours. However, I logged the audio carrier from XHQ-TV channel 3 (65.750 MHz) from Culiacan, Sinaloa, Mexico and the Nevada and Missouri highway patrols on 42 MHz.

>A simple snip of the jumper, and I got it all (cellular, that is).

>Maybe someone can reply and decode the 12A3 sticker.

>Good luck.

I think I know what the sticker means. Peavy uses the same type, the 12 is
the month, and the A3 is the year (93). They assume you can nail it down to a
decade, I guess. If I'm right (and I may well not be), then your 2026 was
mfgd four months before D-Day (April 94).

I have a 2026 that I got refurbished at a RS outlet for $60, hoping It would
be OK (it is a pre-patrolman case), but it only has the L201 holes, no huge
jumper. I bought a refurbished 2006 the same day for $199, and it did have a
D1 and D3, so the day wasn't a total loss.

Also, on the new ones, the microprocessor ends in something like -A or /A,
meaning it is cast from a different die.

> ... the community ... switched to a trunked 800MHz radio system.
> ... tips or ideas on finding them ...

From - ftp://oak.oakland.edu /pub/hamradio/docs/misc/ fcc.allocations

806 - 896 MHz: FM @ 25 kHz steps (mobile 806-851, base 851-896)
[....]
851.0125- 854.7375 General - conventional
854.7625- 855.9875 General - single channels
856.0125- 860.9875 General - trunked
861.0125- 865.9875 SMR - trunked
866.0125- 868.9875 Public Safety - trunked (12.5 kHz steps)
[....]

Besides the 2 MHz dedicated to Public Safety, there are 12 sets of five
trunking freqs. allocated in the 856-860 group. The starting freqs. of
each trunk are: 856.2125, .2375, .2625, .4375, .4625, .4875
.7125, .7375, .7625, .9375, .9625, .9875
If you find activity on one of these, check the corresponding freqs. at
857.xxxx, 858.xxxx, 859.xxxx & 860.xxxx for the remainder of the trunk.

Note that if you are within 80 mi of the Mexican or Canadian border, other
rules apply.

I disagree, or at least I think I do.
I bought a PRO 2026 no more than 4 months ago and modified it easily.
I bought it at a high-volume radio shack, so I can only assume it was not on the shelf for a year. However, I would be glad to check if someone will tell me how to determine the manufacturing date.
There is a sticker on the back of the scanner that reads: 12A3, if that tells you anything.
As to the mods. I found it so easy, it was obvious to me the scanner was built to be easily modified. On an otherwise flat printed circuit board, there was a HUGE thick metal jumper. It stuck out like a sore thumb.
A simple snip of the jumper, and I got it all (cellular, that is).

Maybe someone can reply and decode the 12A3 sticker.

Good luck.

>If this is untrue, please correct me, this is all based on assumptions.

>-Dan
>danzahn@mit.edu

Dan,

I gave this a little thought last night. My guess was that I was
only picking up one side of the conversation as one transmitter was
closer to me than the other. Sometimes this is the cell phone itself,
and other times it is the cell base transmitter.
Your idea above is interesting, but I wonder if the cell phone doesn't
transmit with the same strength, as it can not know how far
away it is from the cell base. So I would assume the cell phone must
transmit the full pi r squared area or a radius of r as well..
So, this leads me to think that the problem in reception is that either
the cell base or the cell phone is out of range while the other is in..

Any thoughts anyone?

The 10 Codes are not standardized. Here in Ottawa Canada we have about
6 or 8 10 codes in use within our region. All of them are different.
For example 10-36 in Ottawa is a time check, but in the neighbouring
City of Nepean, Ont (which borders on Ottawa) 10-36 is a stolen bicycle.
And with the R.C.M.P (Royal Canadian Mounted Police) it is Crullers
are half price at Tommy's Donuts (Grin). So you'll have to get the
copy of Police Call for your area, or check with the local news agencies.

One other thing that makes it more likely that you are hearing the base at any point is that the base doesn't really have any power constraint. If it needs power, power is available, so I don't think cell bases adjust the strength of their transmitters. The cell phone, on the other hand, has to conserve power because the manufacturers would like the battery to last as long as possible making the cell phone only use enough power to guarantee that the base is receiving its signal (plus most phones have indicators that show how strong the base signal is, and the phone can use this information for judging how much power is needed to transmit a signal. I'm not entirely sure if phones do use this information, but I would guess so because of the power arguement). If they do, this would indicate that the radius the cell phone would cover would decrease if it got closer to the base because the power would not be needed.

Thus I would assume in most instances you will hear either just the base or the base and the cell phone.

I find in my scanning experience the above instances are most likely. I have yet to hear just a single cell phone.

Just some more insight.

: : Count Sheriff's Department. I had not monitored them for several years
: : All of the channels alternate between voice and MDT data. It is not
: : possible to monitor this system. They might as well have went to
: : encrypted digital transmission.

monitoring trunked systems ie easy if you know what you are doing.
search until you find the data channel (buzz saw sound)
for example if you found a data channel on 859.7375, the other
frequencies in the group would be 856.7375, 857.7375, 858.7375, and 860.7375
load these in your scanner in order and lock out the data channel. the
data channel may change frequencies from time to time.

>
>I am going into spot news photography and would like to know the
>code.(not 1800-ATT)

There are so many different codes that it would be almost impossible for me to give you a list from my area that would apply to your area. Each agency adapts the codes to best serve their needs.

Example (you used 10-42):
(CA agencies)
Imperial County Regional 10-42 (this code is not listed)
Los Angeles & Orange County 10-42 Pickup Officer
Riverside County 10-42 Transport Item / Pick up ____.
San Diego County 10-42 Ending tour of duty.
Expanded APCO codes 10-42 End shift.
Air police (Air Force) 10-42 Warning issued.
Standard CA codes 10-42 (this code is not listed).
Alemeda County 10-42 Check on Welfare.
San Mateo 10-42 Request ambulance.
Ventura County 10-42 At residence.

(Some of these may not be used exactly as I found them listed).

I think you can see what I mean. The best way to find the appropriate codes for your region is to find a local frequency/code guide at a Ham/CB shop. In most cases, the more localized the freq guide, the better the chance of getting the local codes.

Hopefully this helps!

Robert

Has anyone in this scanner forum bought the AOR-SDU5000 Spectrum Display unit? I would like to hear your comments in this newsgroup as to the performance of this product. And, what radio are you driving it with. I understand that the default configuration is for the AOR-3000A, but there is a optional chip that is available to allow this product to work with the ICOM 7100 and 9000.

Regards,

Steve

"Dan Z." <danzahn> writes:

>it comes with a date code of OEIC.... could someone please help decode the date

If it follows their old pattern, it's 15th day, fifth month, 93 or May
15, 1993. There was some debate whether the first number was the "day of
production" or the "day of the month". Then too, all of our speculation
copuld have been wrong. The last two letters are almost certain to be
the year - my BC200XLT has a code of OCHH - 15th of third of '88 or three
months before I bought it.

Does anyone know where the date code is on a BC3000XLT? DO I have to
take it apart?

>In addition, this radio does not receive between 550 and 760 MHz...
>what is on those frequencies?

TeeVee channels 27 through 48.

>Also, does anyone have the complete list of "hidden" options on the BC's?
>I saw a complete list, but forgot where and forgot to make a copy.

Haven't seen one for the BC2500XLT, only the BC3000XLT>

bishwa wanted to know about amateur transceivers with extended
reception...
i have an icom W2IA, which is transmit/receive on 144 and 440...
plus receive from about 100 mhz to 900 mhz. reception weak
away from the ham bands, and no wide F-M. but does scan
pretty well on the nearby public safety bands. also, no
pad on the scanner. you gotta have three hands to tune it.
would love to find a unit like this with a pad.

i think a w21at exists...plus there are other units that
have full uhf-vhf reception. not sure if they transmit
on multi-bands, though

>businesses in the past 2 years. They are not listed anywhere, you just
>have to figure them out for your self.
>

Same in NY, and elsewhere I have looked.

The interesting thing is that in almost all cases, there is no problem whatsoever.
Maybe Gingrich is right to consider abolishing or greatly reducing
the FCC. Especially with the growth of trunked systems, perhaps there
will be a long period of self-governing low congestion business bands.

For example, if a business band radio system could be set to one of
several hundred (conventional) channels, wouldn't any reasonable business
try to find an unoccupied or low use one?

You might think not... but with so many unlicensed systems out there
a good argument could be made that the system tends to run without
government intervention.

PS, if the FCC is killed and chaos results, I will be sorry I said this!

BC> That may well be, but the other gentleman was looking for cellular
BC> coverage. That's in the 800 MHz band, the relevant portions of which
BC> are permanently blocked in all current scanners.

I'm beginning to get a lot of feedback from people in Canada, and so far, it seens that there are a lot of PRO-43's being sold there which are NOT blocked as required by the TDDRA.
This is probably because they are not intended for sale in the U.S., so Tandy didn't mod them as required here.
Also, Canadian Radio Shacks will (or do) have the PRO-2006 on sale for what I'm told is a great price.
I'm specifically *NOT* recommending that anybody cross the border and buy these scanners in an attempt to circumvent U.S. law.
What anybody does is their own business.

From: Al Gillis <alg@teleport.com>
Message-ID: <3v4elu$2bu@maureen.teleport.com>
Source record: 251577

For what it's worth at the Hillsboro (Oregon) airshow on July 15/16 I was able to copy the Blue Angels on 307.7 during their show.

This appeared to be the leader of the diamond formation calling the timing of their events. I was never able to hear the two solo craft talking (although I think I had them on 307.7 from time to time). I had numerous freqs (those from a message found here in r.r.s a while ago) being scanned by my Yupi 7100 but didn't hear anything but the tower on VHF and UHF and the acts being staged and called in.

The Angels communications was very terse - no wasted words although the leader (a LtCDR) used an almost sing-song approach to his calls. He'd say things like "Diamond, Awaaaaay weeeeeeee go!" and sure enough they'd start a climb or something. As they'd fly over the show area they had their smoke on and it went on and off at the calls "smooooooke OFF!" or "smooooooke ON" with the word smoke drawn way out long and the on or off command given very sharply. it was kind on interesting to hear that they didn't have a lot of chatter going on during the shows. Those Navy pilots are good!

I may be at the Whidbey show later... I'll try to do more scanning but that's tough to do when there are fast movers and pretty girls to keep an eye on!

Legally, none are being offered in the U.S. anymore, as no more could be imported into or manufactured in the U.S. after April, 1994, and stock is long gone by now, unless you get VERY lucky.
Used is probably going to be your best bet. UNLESS, you happen to be in Canada, where, I'm told, non-banned PRO-43s are still available, and possibly many others as well.

From: rcn9jig@aol.com
Message-ID: <3v4mja$dkg@newsbf02.news.aol.com>
Source record: 251585

Which route will you use?

CNW Routes use either 160.890 or 161.040
BN uses 161.100
MILW District uses 160.770 or 161.520
Rock Island District used 161.610, but now is on 161.340
Metra Electric uses 161.025
NS District uses 161.250 or 161.340
The Heritage Line uses 161.190 or 160.920

As author of several of the Scanner Master books (Illinois Communications Guide and the ChicagoLand Pocket Guide) I obviously have a bias toward ScannerMaster books. I also buy every volume of Police Call every year. Scanner Master books are great for a particular area, and if your area is covered by one, you can't do better. But not all areas are covered, so something else is needed. PC has a lot of info, and can be invaulable with a little understanding of what you are looking at.

With a little research, the data in Police Call can give a lot more info than just the numbers shown. For example, the repeater input for a VHF system can be found often times by looking for a "CO" listing, or mobile only listings. The notes to the left of the freqs are supplied by readers, and is usually pretty accurate.

Most errors in PC are made by the FCC, and are present in any form of FCC database listings (Even the USSN book, and PERCON/Grove CD's). If you take a look at old copies of PC (I have a copy from 1975) You can see how much better they are now.

The best wayt I can put it is: What works for you is best for you.

On AOL and the CARMA BBS ((708)852-1292) is a demo version of WAVE. WAVE is the first Macintosh OS456/OS535 program available, and works great. It uses the Mac's graphical interface, and presents the freq and PL codes in a movable pallette. As many windows as you can handle can be opened at a time, and you can either chose from pre-designed or custom made search ranges/scan lists.

E-Mail to "MikeASL@AOL.COM" for details.

Bill Cheek (bcheek@cts.com) wrote:
: >My 43 has an 'A' in the FCC ID, but not in the serial number.
: >Could the unit be modified?

: Possibly. But the real criteria is the date code which has to be 2A3
: or prior. It's a small label in the battery compartment.

As keeper of the 43 modifications FAQ, I have to disagree. There have been reports of Canadian units with later dates of manufacture that have been modifiable. The *only* cirterion that has stood the test of time is having an A in the *serial* number. If so, unmodifiable; if no, it can be modified. Has anyone anywhere seen an exception to this rule? If so, let us know--it's *NEWS*.

Hello all,

Does Anyone have a schematic or manual for a Relistic Patrolman CB-9?
Has anyone tried to allign one of these?

It should be located on the back cover of the owners manual.
Tandy and Sams does not have a repair manual, I've tried.

If anyone could fax or scan the back of the manual, please let me know.

Thanks,

I believe if you turn the scanner off, hold down the 2 , 9 , and " L / OUT " key simultaneously while turning it back on will initialize the memory and put a cellular frequency in channel 23 (or channel 17, I'm not sure). This will erase all of your programmed frequencies. Also if the serial number ends with an A it has been modified at the factory and cannot be restored. Even then you should be able to search up from 896.1125 Mhz to about 922 Mhz and pick up image frequencies pretty clearly. At least this is the info I have heard. Have fun

"Trunked" can be related to a bank line. When you wait in line
for a teller you do'nt go a specific teller (frequency), you go to the
first available teller. That is how it works, when someone keys up it
goes to the first available frequency. It is very efficient but is a pain
for scannerists. There are two sets of frequencies, a high and low
numbered set, the low is the control and the high is the repeater. Listen
to the repeater set. Program them in backwards (from the highest to the
lowest of the repeater frequencies) because that is how the system locates
the next available frequency(Icould be wrong on this). It makes it easier
to follow a conversation. Also you must continually lockout the "data"
channel. This is the channel the system uses to control the radios. It
is changed every couple of hours and sounds like a buzzing sound.
I hope this helps. If I am mistaken please correct me.

Pat

The SDU5000 is available in either the AOR or Icom versions. You are
correct that the only difference between the two versions is the chip
installed in the unit. AOR has also recently upgraded the chip for
the SDU5000, so that future units will have compatability with both
AOR and Icom contained in one unit.

All the best,

These scanners came under the new rules when they were imported. However,
due to a mistake, one of the test frequencies was in the cell band, allowing
the cell freqs to be searched. Since this was illegal, the FCC required
Tandy to re-call all unsold/undelivered examples to be fixed.
Those examples already sold and delivered were not re-called.
Even units on lay-away had to be returned for the cure.

A couple thoughts on this subject...
I have found that sometimes I hear both sides of the conversation and other times just one side. I usually then lose the thing although can occasionally "search it down" if I'm so inclined. I've concluded that I'll eventually lose any conversations by travellers. That is those speaking in cars or trains etc. regardless of whether they are using a car phone or portable. However, I've heard conversations that will gone on forever(hearing both sides great)when the cell person is *stationary*. I know this because the person says something to indicate their position. "I'm Parked in my driveway" or "I'm in the backyard on my portable cellular" etc. At least this has been my experience...

The $75 price sounds high for Radio Shack's first programmable portable scanner. The PRO-30 was a good scanner in its day, but that was long ago and it's not attractive by today's standards. It has only 16 channels, scans slowly, and requires two sizes of battery.

I've had 7 PRO-30s due to various defects. Here's a brief report I wrote *several* years ago.

The Radio Shack PRO-30 Synthesized Scanner

Robert S. Parnass, AJ9S

I recently purchased a Radio Shack PRO-30 synthesized handheld scanner. Here are some details:

o Price: $300.

o Batteries are not included. The PRO-30 requires 3 "hearing aid type" batteries for memory retention and 6 AA batteries.

o Frequency coverage is fixed. The manual states: "In case you're wondering, the tuning range of your PRO-30 is permanently stored in the micropro-cessor chip. There's no way it can be extended or altered - even by a skilled electronics techni-cian. So if you try to enter a frequency not in the PRO-30's tuning ranges, you'll get an error message every time!"

o 30 - 54 (includes entire 6 meter ham band)

o 108 - 136 (AM commercial aircraft band)

o 138 - 174 (includes some military frequencies below the 2 meter ham band)

o 380 - 512 (several military and "secret" US government frequencies in this range)

o Semiconductor components: 1 LSI microprocessor, 1 LSI PLL chip, 3 CMOS chips, 5 other chips, 39 transistors, and 75 diodes!

o Selectivity: +-9 KHz @ 6 db., +-15 KHz @ 50 db.

o Scanning rate: Fast = 10 channels/second, Slow = 5 channels/second.

o IF frequencies: 10.7 MHz and 455 KHz.

- 2 -

o Current drain (not including memory backup cells): 55 mA squelched, 100 mA unsquelched at full volume.

o Priority Sampling: 2 seconds.

o BNC antenna connector. A multi band semi-flexible antenna is supplied.

o The case is plastic, with a hinged, spring loaded belt clip on the rear. The inside of the case has been sprayed with some type of gold colored RFI shielding material.

o The keyboard buttons are made of a rubber type material, that compress slightly when depressed. An audio tone is used to confirm key depression.

o Three pushbutton switches on the top of the unit duplicate functions on the front mounted keypad:

a. Scan

b. Manual

c. Speed

This allows the user to manipulate these functions while the scanner is worn on the belt.

o The PRO-30 is made in Japan by GRE, the same company that makes Radio Shack's crystal controlled scanners.

o The owner's manual contains a block diagram, but no schematic. I am told that a service manual, with schematic, will be available for sale. The owner's manual contains a list of "birdies."

Some early impressions:

o The scanner works quite well.1

---

1. The PRO-30 being reviewed is one of the first available in the northern Illinois area. Early models of complex radio equipment from other companies have been plagued by several problems. Examples are the Drake TR-7

- 3 -

o The instruction manual is pretty good, although a schematic should be included.

o The scanner is bigger than the Bearcat BC-100. No leather case is available to protect the PRO-30, so the scanner could be "bruised" in heavy service.

o The LCD display contains several status indicators, including a low battery warning message.2 The display is quite crisp and clear in bright light, and when the internal dial light is activated. It is difficult to read under low lighting conditions and at various angles, a characteristic of LCD technology.

o Striking a key does not always actuate the desired function. If a key is struck off center, the rubber key top compresses without actuating the switch mechanism. The user is made aware of this situation when no audio tone is heard after a key depression.

A nice aspect is that the keyboard is less prone to damage if it is struck against the corner of a desk.

o Sensitivity on UHF is at least as good as the several crystal controlled portable scanners I've aligned, maybe even better!

o In Search mode, scanning will stop only when the radio is tuned to a station's center frequency. A "window detector" circuit3 prevents lock up on adjacent frequencies.

---

transceiver, the Bearcat BC-100 and BC-300 scanners, and the Collins KWM-380 transceiver.

2. The user is also warned of failing batteries by a audio alarm.

3. A similar circuit is found in certain Bearcat synthesized models, such as the BC-250. The original patent for this circuit is assigned to General Research Electronics (GRE), as are several other scanner patents.

- 4 -

o The internal construction looks decent. There are two printed circuit boards in the radio, connected via a multi pin connector rather than messy wiring harnesses. The component designations (e.g. R102, C212, etc.) are printed on the board. Resistors are 1/8 watt and mounted vertically. Layout appears clean, not overcrowded.

o The priority scan feature works well and uses a "reasonable" algorithm, like that used in most Bearcat and Regency scanners.4

o Audio output circuitry uses the LM386 audio amplifier chip, producing about 220 milliwatts of audio power out.5 This is a bit on the weak side if you're using the scanner in a truck, or wearing it in a noisy situation without benefit of an ear-phone or external, clip-on lapel speaker. The audio is crisp and clean, without synthesizer noise.

o The 2nd IF, FM detector and squelch circuitry is implemented using a Motorola MC3357 IC, now quite common in scanners.6

---

4. The algorithms used in most Japanese 2 meter ham radio transceivers, discussed in a previous article, are not very useful to American amateurs.

5. The LM386 is also used in the PRO-24 crystal controlled handheld scanner, reviewed in a previous article. In both models, the speaker element is only rated for 100 milliwatts.

6. The squelch function works quite well and is not plagued by the hysteresis problem found in the PRO-24.

From: hwalker@swri.edu
Message-ID: <DCCAzJ.E1r@serval.net.wsu.edu>
Source record: 251611

I am looking for any info concerning mods that can be done to a pro-2032. I have not seen anything on this scanner. Thanks.

1727. [QUESTION] What is the most fun thing you have done?

Newsgroup: rec.radio.scanner
Date: 1995-07-26 00:00:00 UTC
From: jwt55187@uxa.cso.uiuc.edu
Message-ID: <3v6ata$i88@vixen.cso.uiuc.edu>
Source record: 251612

Hi,
I am looking for good ideas for things to do with my scanner. I'm sure that others here are doing the same. So could people post what they enjoy using there scanner for the most, and offer any fun,exciting, or interesting things or places to scan.

Thank you,

Jeff Thompson

Your rig was manufactured Dec. of 93. As I mentioned, if it had been
built April of 94 or later, you're up a creek as far as cell restoration.

Has anyone played with burning some EEPROM's for one of theese new
radios? I for one would like to find out the secret to just how the
800mhz coverage is being locked out. Perhaps we could clone a chip from
an old model? HMMM........?

ATTENTION ATTENTION ATTENTION ATTENTION

CableVision Of Hauppauge Subscribers

On Sept 1,1995 Cablevision will DROP Broadcasting the NASA SELECT TV Service
that is on channel 1/52 from 10am-4pm 12am-6am.....

I think the only way to save NASA SELECT is by calling Cablevision
and telling them to keep NASA SELECT.. Even if you don't have
CABLE TV or CableVision of Hauppauge you should call. I heard
that they are dropping NASA SELECT because they never get calls
praising there REBroadcasting of NASA SELECT..

So come on and give them a call, or if you want to watch NASA SELECT
you'll have to get a Satellite TVRO 10ft Dish...

*** The 18" DSS (DBS) System does NOT have NASA SELECT ***

CableVision can be reached at (516) 348 - 6800 Main Switchboard
348 - 6700 Sales
582 - 8324 Marketing
348 - 6872 FAX

CALL NOW .... We can't lose NASA SELECT

Thanks for the HELP,

Keith

The Icom IC-2SRA is a 2m tranceiver and a 25MHz - 950MHz scanner (AM, FM, WFM). The current version has
the 800-900Mhz band cut out because of the celluar laws. The IC-4SRA is like the 2SRA but it has a 440 Mhz
tranceiver instead of the 2m. Scan rate is a bit slow, but it is one of my favorite radios and I'll probably never
part with it!

Standard alsom makes several HTs that have very wide receive coverage.

From Monitoring Times Dec. 1994, Bob Groves Tip O Month.
Cellular Restoration for "New" Pr0-51 (I am assuming newer
Than 7A4).
With the scanner switched off, hold down the BAND, 2, and9
keys and turn the scanner on. Now in the digit test mode
all digits of the LCD will move slowly from the left to the
right of the display.
When the movement advances nearly to the right end of the
display, press and hold the LOCKOUT, 2 and 9 keys until the
digit test mode stops. The display will blink, then the radio
will begin scanning the factory-preset test frequencies.
Manually step to channel 23 which will display 888.960 MHz.
roughly the middle of the cellular band. Start a normal
direct-search routine from this frequency to cover the
cellular frequencies.

While it is lawful to own a cellular-capable scanner, it is NOT
lawful to monitor cellular conversations.

Promise you won't do it.

Hi Jeff!

To answer the question what's the most fun thing I've done (with my scanner ;>)), I'd say that the Sussex, NJ Airshow last year was one of the most fun things I've monitored. But I suppose that's dependent on my own personal enjoyment of airshows. Your idea of fun might change with your own personal hobbies and interests. Sports events, concerts or Shuttle Rebroadcasts may be your cup of tea.

I used two scanners, a pro 35 and pro 43, an Optoelectronics frequency counter to find those 'unlisted' frequencies, and a rented video camera. With the pro-43 on my belt clip, I connected Walkman style earphones to it (the type that fit into the edge of your ear). I put one in one ear, and taped the other over the end of the video camera's microphone. And Presto! I recorded all of the stunts with the sound of the PA giving music and commentary,and the scanner earphone giving pilot to pilot or pilot to control tower chatter. I edited the video down a bit and have a great souvenir of my visit.

Another thing I enjoy is just having the scanner 'handy' when something's going down. I was at an outdoor concert at the New Jersey Shore and near the end of the evening - very suddenly (it always is) - the Police, Fire and EMS crews came rushing into the bar's parking lot. We all watched as they ran out to the beach and pulled some guy from the ocean, bloodied. I ran to my car (I brought my aforementioned electronics and frequency books) grabbed a scanner, programmed in about ten frequencies and was monitoring the action in no time. As I returned to the club and my

friends, with the radio in hand, they realized what I had and sort of gathered around me as I relayed information on the status of the near drowning victim. We monitored the ambulance crew packing the guy into the ambulance, the police closing off intersections on the route to the hospital, and coordination with LifeFlight for a possible evacuation of the victim. The LifeFlight was later cancelled.

This sort of thing happens all of the time, usually when I'm away home. So, always have a scanner, frequency book and/or frequency finder with you. It'll pay off.

Some of my more interesting scanning....

Here's an offer you can't refuse. U.S. Scanner Publications is offering a three month trial subscription to anyone that sends in a list of their local public safety frequencies with their usage.
The information will be incorporated into their future Frequency Almanacs as well as shared with the users of the U.S. Scanner News BBS at (360) 695-0678.
Just send the list to U.S. Scanner Publications, P.O. Box 14903, Portland or 97214. You may also E-Mail it to them but make sure you include your name and address so they can get your copies of USSN to you,(NOTE: All names and addresses are confidential and NEVER given out to anyone.) Send E-MAIL list to USSN@pacifier.com.

I've been looking for the freqs also for the Seattle race. Got a chance to talk to one of the crew members on the Budweiser team the other day. He didn't give any freqs but told me that on race day they scramble. He also said that comms would be in the clear during qualifying.

1749. @@@@FREQUENCY COUNTER@@@@

Newsgroup: rec.radio.scanner
Date: 1995-07-27 00:00:00 UTC
From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <769_9507271005@tor250.org>
Source record: 251387

Hi.

-> DOES ANYBODY KNOW OF A FREQUENCY COUNTER WHICH CAN PICK UP
-> FREQUENCIES BETWEEN THE RANGE
-> OF 0-900HZ OR 3-10 GHZ.

When you do get a fix on those frequencies in those ranges, what scanner on the market is going to pick them up?

You're first request of 0 - 9 Hz is more like, to a scanner, 0 - 0.9000 Mhz and the latter, 3 - 10 Ghz, translates to 3000 - 10000 Mhz.

I don't think that there is a scanner on the market that is capable of such feats. Or for that matter a frequency counter as those are usually only capable (a good one) of about 25 - 1300 Mhz (1.3 Ghz). Besides, what the hell are you going to listen to in those ranges, anyway?

Strange. Very Strange.

Cheers,

Vaughan

Michigan State Police M.S.P. frequencies:
42.02 Detroit Post 29
42.58 Weight scales
42.68 Northville Post 21
42.94 Pontiac Post 27
42.86 Mt Clemens Post 24 Romeo Post 22
42.74 Statewide
42.64 Howell Post 12

You'd be pretty safe to search from 42 to 43 Mhz and cover them all.

M.S.P. uses X-band, K-Band wide KA and Laser and aircraft.

Most often they will work with the city the freeway runs through and use
the cities frequency for aircraft operations. Such as a channel 2 or 3 or
a simplex UHF frequency. So there isn't a standard freq that is used from
the air.
Also if you aren't a licensed HAM or you don't have a scanner permit
issued by M.S.P. you'll be in violation of state law, so keep it hidden.

Good luck.

I guess we have to ignore the subject line...we aren't talking about images. We are now talking about what side of cellphone conversation you can hear.

"Dan Z." <danzahn> wrote:
>>Dan,
>>
>> I gave this a little thought last night. My guess was that I was

>>
>>Any thoughts anyone?

The "coverage area", or range, of a channel from a cell site and the range of cell phone are different. A hand held cellular phone transmitting at 600mW through a stubby antenna will not have the same "range" as the cell site (what everyone around here always refers to as the "base").

When you are hearing only one side of cellular call your are listening to the mobile. When you hear both sides, you are listening to the site.

>One other thing that makes it more likely that you are hearing the base at any
>point is that the base doesn't really have any power constraint. If it needs

>do use this information, but I would guess so because of the power arguement).
>If they do, this would indicate that the radius the cell phone would cover
>would decrease if it got closer to the base because the power would not be
>needed.

Technically the cell sites do have a power constraint. The legal power limit is not a real problem...the rules allow a max ERP of 500 watts (the limit goes down as the height above average terrain of the site's antenna(s) increases). The practical constraint is that the channel can, and almost certainly is, used by other sites in the system. There is a limit on the power a cell site can

transmit without effecting co-channel operation from another site.

It would be generally safe to say that an average, sectored cell site uses about 5 to 10 watts per channel with an ERP of maybe 50 watts.

The mobile's power need to be controlled for several reason. It's primarily to ensure that the mobile does not cause co-channel interference. The cell site doesn't move so it's signal is easy to control with antennas. The mobile can move to the upper floors of a building where it may obtain some effective gain - too much of this "free gain" and it could cause co channel problems. The mobile does not determine what power it should use - it is instructed to go a certain power level by the site based on signal strength.

>Thus I would assume in most instances you will hear either just the base or the >base and the cell phone.

Mentioned above, you would probably hear just the mobile on the mobile's frequency, or the cell site and the mobile on the site's transmit frequency - which is 45 MHz above the mobile.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from | 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly. The Plectron 500 series is less desireable.

I use 6 Plectrons in my living room, 7 Plectrons down the basement and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks down downstairs. Power to them is controlled by modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I fixed and restored each one, recrystalled them on local frequencies, and distributed them to members of my scanner club who were glad to get them.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. | Plectron receiver repair service is offered by:

Woodson Electronics/Plectron |
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985 |

Some replacement parts are currently available from Federal | Signal in University Park, IL, phone (800)524-3021. | Woodson is negotiation with Federal Signal to be able to | sell replacement parts for older Plectron receivers. |

Alert Monitor parts are available from Motorola. Phone | (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-60 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high

frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter,

expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at

9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The

space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your

office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an

unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern

states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All
meetings will be held on Saturdays at locations announced
in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave.
August 19
October 14
December 16

Bring a notebook.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as

identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.
Radio Shack PRO-2004	R148 47K	remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K	replace 33K with 220K. Between pins 12 & 14 on IC-1 MC3361
Radio Shack PRO-2035	100K	replace 100K

	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 110 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a
mobile or base model. Portable scanners are subject to
more physical abuse and many have been dropped. If a radio
has been dropped, the laws of probability dictate that the
first point of impact was probably a corner, so be sure to
examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration,
dust, and temperature extremes. This shouldn't dissuade
you from buying a used mobile scanner, but be aware of
possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor | performers didn't interest consumers of that era and you | should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR |

AR2700: 1995 vintage. 500 channel portable covering 500 | kHz to 1300 MHz. Lots of good features, e.g., 10 linkable | search banks, lighted keypad, per-channel attenuator, S- | meter, battery meter, optional voice recorder and speech | inversion descrambler. Global rescan and pause delays, but | no auto store, data skip, nor battery saver. Internally | generated noise results in broad birdies on AR2700 tested. | Insensitive carrier operated (vs. noise operated) squelch | stays closed on signals unless they are moderately strong, | causing scanner to skip transmissions of interest. |

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent

channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). | The only Bearcat crystal controlled base/mobile scanner | offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of

BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models -

most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO2006: 1990 vintage. Essentially the same as PRO-2005 | but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob

Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus

aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning and 2 mA while | turned off.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to

cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. Audio suffers from small speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO43: Good portable 200 channel scanner using up conversion. Covers military air band. Selectable AM/NFM modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes |
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from Federal Signal in University Park, IL, and may be available in the future from:

Woodson Electronics/Plectron
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The third edition is available from | Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel

(e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542

Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist

called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to

determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their

transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics and Parts Available

Some schematic diagrams may be obtained from |
Uniden/Bearcat's parts department, (800)297-1023 or |
(317)842-2483. Uniden currently charges a flat rate of $54
for scanner repairs. They will repair and return "out of
warranty" items without an estimate unless the repair
charges exceed the flat rate charges. The phone number for
repair is (800)297-1023. |

If Uniden doesn't have a schematic, try obtaining a |
Photophacts from Howard Sams Publishing division of |

Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Athough there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually

available from UNIDEN, but replacement requires dexterity,
as one must take care not to tear the flat, flexible strip
connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor.
Another problem is when none of the keys seems to function;
the receiver just keeps scanning in spite of key
depressions. I found this condition in a BC210XL scanner
owned by a heavy smoker. Perhaps nicotine smoke was to
blame, as the resistance between two input port pins on the
microprocessor was down to about 1000 ohms, fooling the
microprocessor into believing that a key was stuck in the
"down" position. Scraping the circuit board between the
two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Source record: 251501

This is a common question and complaint about that range. Considering the band is 175Mhz wide and 25 or 50 Khz channel spacings are common, it would be a difficult task searching that area, unless you have a very high speed scanner with auto search/store facilities.

I highly recommend picking up one of several military frequency guides available. Grove or any ham radio store like Ham Radio Outlet carry these guides. Target a 3-4 state area and be ready to load 200 or more channels. Not all channels are used at all times, so that's the reason for so many.

I have nearly 300 channels entered and remote tape everything. A 24 hour period gives me at least 1 hour full of tape (no tape gaps). I hear everything from the uninteresting to live weapons training missions.

Don't neglect the 30-50Mhz band, there is plenty of interesting Army and Air Nat'l Guard activity there. Search 30-30.56, 32-33, 34-35, 36-37, 38-39, an 40-42 Mhz areas for military traffic. You'll catch base ops, helo's, and convoys there. Keep in mind most helo activity ends up on UHF (225-250Mhz region), but you will hear plenty down around 38.4 and 38.7 Mhz.

Good hunting!

Andy

Any ideas as to which frequencies/range of frequencies the TV news helicopters might use between the reporter/camera crew and the studio? I assume these would be different than the frequencies used by the pilot to talk to the tower. ;-) It might be cool to listen in on the next White Bronco freeway chase. ;-) ;-)

Anyone?

The 2006 will automatically select the correct mode (usually NFM for what you want). The only time you
really need to change modes is in the UHF military air band where (I think) the default is NFM instead of AM.

If you have the time, it is a lot of fun to actually go to the scene of what you are listening to.
One caution though, if it is a surveillance operation, keep a very low profile, or you might cause
problems.

One of my favorite things to listen to is search and rescue operations.

Nope, after trying this sequence on a 8A4 Pro-51
channel 23 conatins 852.xxx MHz, not 888.xxx.
Almost the same frequency as channel 22.

I have seen this sequence posted here before and
it still doesn't work. Only a 7A4 or older Pro-51
will load the proper test frequency. I found a 7A4
unit at a local Radio Shack and they refused to sell
it to me (it was the demo unit on the shelf). They
said that it had to be "turned in".

>*The Guild

~~~~~~

Hi Jeff, here's my take on the situation:

The reason you're hearing only one 'side' of the conversation is that
there are two frequencies at work with cell (as with cordless). To the
best of my knowledge:

1) The first frequency transmits from the handset to the base (be it cell
or cordless) and carries only the voice of the person using the cell or
cordless phone to the base receiver where it is sent out through land
lines.

2) The second frequency from base transmitter to cell/cordless receiver
carries both the person's voice at the other end *and* the voice of the
cell/cordless user mixed together so that the cell/cordless user hears
the person they are speaking with and their own voice.

If you've ever used a phone that doesn't mix your own voice into the
earpiece it sounds 'dead' because you're used to hearing your own voice
through both ears when you speak normally. So, you're probably hearing
frequency #1 above, where you can't hear the other side at all or you're
hearing that frequency with a little of the other side mixed in. The
reason you hear a little of the other side of the conversation may be for
these reasons:

1) The cell user is in his car with hands free - microphone/speakerphone
capability. In this case the microphone in the car will pick up some of
~~~~~~

the other side because it's 'hearing', or getting feedback, from the speakerphone. Some cell phones have a noise gate that will cut out the microphone when the loud cell users voice doesn't break the threshold. In that instance, the speakerphone on the handset may not be loud enough to break the noise gate to get the "other side" therfore: one side only.

2) The handset microphone may have a very sensitive omni directional microphone that actually picks up the other person's voice from the small earpiece speaker which is only maybe six inches away. There again, the phone may be 'smart' and is turning up the gain all the way when it gets silence from the user, and in that way it's picking up the other voice. Then you'd get a faint 'other side' of the conversation.

Questions? Comments?
I'd like to hear from someone on the "inside" of the cellular biz who has more technical knowledge than I do about this.

Hope this helped you

Thank you for your interest in TUNE-IN: The Ultimate Scanner Database.

TUNE-IN is a scanner database system developed with the scanner
enthusiest in mind. Designed to complement todays high tech scanners,
TUNE-IN provides the user with the easiest way to keep track of the
hundreds of frequencies in their scanner with the most organized,
managable and user friendly interface available to satisfy the most
demanding scanner user.

TUNE-IN has been designed to work the same way as your scanner does.
Most scanners have internally two things associated with each frequency;
a
CHANNEL NUMBER and a BANK NUMBER.

These two items help you locate and organize the frequencies stored in
your
scanner.

CHANNEL NUMBER: Every frequency in your scanner is assigned to a
CHANNEL NUMBER. This channel number is generally between 1 and 100.
Some of the more advanced scanners allow up to 1000 channels to be
stored within the unit.

BANK NUMBER: In most scanners the user is able to store many channels.
These channels are broken down and stored in seperate BANKS. These
BANKS allow for easier access to the needed frequencies. Banks allow the
user to put specific frequencies in seperate areas to aid in the scanning
of
related frequencies. For example, one bank may be programmed with the
police and fire frequencies for one city, and another bank be programmed
with the frequencies of the local airport. Most scanners have 10 banks
in
them. These banks may have anywhere from 10 and 100 channels each.

TUNE-IN has been designed to perform to the needs of the mega scanners.
It allows for inputing of up to 15 BANKS, with each bank containing up to
100 CHANNELS. Since each BANK is saved as an individual file, the
actual number of BANKS possible are infinite.

Unless the data can be displayed and printed in a way that is convenient
for the user, it is useless. TUNE-IN allows the user to select how the

data
will be printed. It can be printed as handy, pocket-sized cards, or as
full
page reports. And you only have to print the BANKS of data you want.

TUNE-IN is the most feature packed scanner frequency database available.

TUNE-IN....sure to set the NEW standard.

TUNE-IN is available from the major ham shops in the US, including Grove
Enterprises and Tucker Electronics, or direct from the author.

I hope you find this information helpful. Feel free to contact me should
you have any additional questions.

For IBM and Compatible Systems (DOS Version)

Price: $24.95 US dollars

To order direct from the author please include a check or money order
for $24.95 + $2.00 (postage) and mail to:

David W. Carroll
2310 Pembroke
Suite 100
Garland, Texas 75041

Please indicate 5.25" or 3.5" disk

Please note: checks may take 10 days to clear before shipment of order.

Does anyone know what the headset/extender frequency of the Calif. H.P. moto-cops is? I know the cars use 154.905 MHz, but a motorcyle cop (who, unfortunatly I got a REAL good look at yesterday) had a stubby-duck antenna mounted on the center-front part of his "dash board" just inside the fairing's windshield. It was only a couple inches tall. Looked more like 800 MHz or something like that.

Sure would be nice to put it on my scanner list and use it as a proximity detector. ;-) Any ideas? ---Mike

I needed to increase the gain in the 150-160Mhz range on my PRO-34, and tried something a little goofy, but it worked.

I took about 22 inches of 10 gauge copper wire (household wiring works fine) and soldered it into a PL-259 type plug (10 gauge fits the solder type center connector near perfectly), and used a PL-259 to BNC adapter to attach it my scanner.

After this attempt worked, I bought a piece of 3/32" piano steel, and replaced the copper. Works wonderfully.

Hi Vaughan,

-> DOES ANYBODY KNOW OF A FREQUENCY COUNTER WHICH CAN PICK UP
-> FREQUENCIES BETWEEN THE RANGE
-> OF 0-900HZ OR 3-10 GHZ.

VH> You're first request of 0 - 9 Hz is more like, to a scanner, 0
VH> - 0.9000 Mhz and the latter, 3 - 10 Ghz, translates to 3000 - 10000
VH> Mhz.

VH> (1.3 Ghz). Besides, what the hell are you going to listen to in those
VH> ranges, anyway?

Well, Microwave ovens operate at 2450 Mhz (just below what he wants) so
maybe he wants to hear his food cook.

Also Police radar operates at 10525 Mhz (just above what he wants) but
using a freq counter as a radar detector wouldn't work, it probably
wouldn't pick up the radar until the cop was pulling you over.

BTW they came from Haruteq.

Dean :) Fido: (1:250/930)

From: ruscello@alpha.ico.olivetti.com
Message-ID: <3v7i5h$pej@sfgw.ICO.Olivetti.Com>
Source record: 251530

In article <806384461.20560snx@genes.pl.my>, wired@genes.pl.my (Eugene Kang) writes:

>How does a CB antenna perform on receiving 2 meters?
>

Hi !
Ever wire (phone cable, phon cable etc...) can receive a radio signal BUT
BUT BUT ... it isn't at the right lenght !

The basic formula for calculating a basic antenna is:

300000
----------------- = Full wave antenna lenght expressed in meters .
Frequency in KHz
stub stub
At this point for make a dipole antenna ------||------
||
||
take the value obtained in precedence and multiply it at 0.5
to obtain a 1/2 wave antenna (the reason is electrical I=Max)
and now the value obtained has to be divided by 2 to obtain
the lenght of the single stub of your dipole.

Example :

I have to make a 1/2 Wave dipole antenna for the 27 Mhz . (Right ?)

1st step

300000
--------- = 11.11 meters
27000

2nd step from here to here
| |
V V
11.11 * 0.5 = 5.555 meters (total lenght of your dipole) -------||-------
||
||
50 Ohm coax cable + connector

divide this value by 2 and obtain 2.7775 meters that is the single lenght
of one stub.

At this point (this is only a part of the real calculations) your base antenna
is potentially ready to receive and transmit on the selected frequency.

In the formulas are also important the diameter of the wire and a lot of things
that I at the moment don't remember.

IMPORTANT: If this dipole is to be used for transmitting BEFORE to initiate
the use of it you have to tune the antenna with your rtx, because
you have to adapt the SWR ratio at values not above the 1.5.
To do this you need a SWR instrument and a pair of cutter to short
by cutting the edges of the dipole of 1:2 mm at time.

If you want more explanations ...

Yes, as mentioned before you can get one a lot cheaper than that if you
really look around. The other thing I need to mention is that my unit
gets A LOT of intermod from nearby NOAA weather radio, pagers & a local FM
broadcast station here in the Metro Baltimore area all across the Aircraft
& VHF-HI bands. Once I travel a little out to the suburbs then it clears
up. The other bands are almost free of any intermod even in downtown
Baltimore. The unit does have excellent reception especially in the 800
MHz & UHF range.

Dear Phil,
I dont know if I can help you much but here in Australia the 225-400
Mhz frequency range is used by the military aswell. I personally
haven't heard much up there. I understand that here in Australia these
military freqs. are used by the airforce and the U.S navy have their
FLEETSATCOM sattelite freqs. here too. Aviation freqs. are usually
heard in AM mode. FLEETSATCOM freqs. are heard in FM mode.
CHEERS :)

Date: 1995-07-28 00:00:00 UTC
From: garnold@chaph.usc.edu
Message-ID: <3va696$30g@usc.edu>
Source record: 251409

In article <3v956k$le2@cnn.exu.ericsson.se>, eus.eusmge@memo.ericsson.se says...

"Does anyone know what the headset/extender frequency of the Calif. H.P. moto-cops is? I know the cars use 154.905 MHz, but a motorcyle cop (who, unfortunatly I got a REAL good look at yesterday) had a stubby-duck antenna mounted on the center-front part of his "dash board" just inside the fairing's windshield. It was only a couple inches tall. Looked more like 800 MHz or something like that."

From my large black book: according to a reliable source (CHP internal) the MOTOR REPEATER is F7 in their handheld radios and *is* 154.905.

Hope that works for you. I have heard traffic on 154.905 from motors on traffic stops. I'll ask around.

Nothing. Maybe you're just hallucinating.

1826. Re: Washington state Ferry Freqs

I'd also be interested in getting those freq's if you get them.
Just getting into computers but have been into scanners for awhile.
If you want to chat my address is rhholmes@aol.com
Thanks.

1827. Cols. OH/Freq for AEP/Cols and Southern?

Newsgroup: rec.radio.scanner
Date: 1995-07-28 00:00:00 UTC

Having just reveived my BC220xlt and book of OH frequencies from Mr. Scanner, I set to surfing the airwaves. One freq I CANNOT find, however, is a radio frequency for AEP (American Electric Power?) or their local Columbus version, Columbus & Southern Electric Power. Anyone from the Columbus vicinity out there with a pointer?

Thanks,
RossR

I think the frequencies are 151.715 151.775 151.745 The thruway
repeater is 453.425 base and 453.525.
I've never tried Darien Lake. Let me know if they work.

The DS8000 is a small board installed inside the AR8000 which allows
for decoding of signals with single band frequency inversion
scrambling. This option, once installed, is activated via the
keypad. The dial knob is used to tune to the scrambled frequency,
and then you chose from four possible inversion frequencies to
select the proper sound.

I will be in Aspen next week on vacation and would like
to get my hands on Police, and Fire/Rescue freqs for the area.

Can anyone help me out???

Thanks in advance.....
